It is a common belief that the mind of the mother has an influence over the shape of her infant; but although some singular coincidences have occurred, there is no scientific proof that such is really the case. Yet the theory was universally adhered to in the Middle Ages: it was, in fact, often appealed to in the interest of mercy, as a loophole of escape for pregnant women who, by the barbarous ignorance of the time, might be condemned to torture. Even at the present day no scientific demonstration to the contrary has proved sufficient to undermine the absurd belief. That deformities are in many cases hereditary may be seen in the instances of additional fingers and toes and of harelips. It seems uncertain whether the male or female parent chiefly influences the occurrence of deformity in the offspring. Cases are reported of a family of three with harelips whose father alone is similarly deformed; and another family of three with perfectly formed mouths whose mother has an uncorrected and extremely unsightly harelip. The chief congenital deformities may be classed under the following heads: 1. *Deformity as regards the number of parts.*—The Sirens, for instance, have apparently but a single inferior extremity, which tapers to a point, and the Cyclopes have but one eye. In some cases the head itself or some organ, as the brain, may be absent. Such deformities, from a deficiency of part, may also result from amputation of portions of the limbs of the fetus, when still within the uterus, by the pressure of the umbilical cord. Curiously enough, however, it often happens that this intra-uterine amputation of parts leads indirectly to an exactly opposite condition, viz., a multiplication of parts arising from the stumps left by these uterine amputations, the fetus in the early stages of its growth appearing to possess something of the power of reproduction of parts observed in many of the lower orders of animals. The parts most commonly reproduced are fingers and toes or, most commonly of all, only abortive portions of these, as little projections from the stump of the limb, with traces of nail, and sometimes a single joint with an imperfect bony development. We see a new growth of little fingers or toes according to the member lost, and this power shows itself sometimes without being preceded by such an injury, in additional fingers, toes, etc. These parts are generally close to the similar natural ones, but not always, as, e.g., an ear in the neck. 2. *Deformity with regard to size or volume.*—This may involve the whole body, as in dwarfs, of whom there have been some remarkable peripatetic specimens: the Corsican fairy was only 2 feet 7½ inches high; Mademoiselle Crachami, the smallest child that ever lived, died at 10 years of age, only 20 inches in height. This kind of deformity is not necessarily hereditary: the father of Borowlaski, who was only 39 inches when 30 years old, had six children alternately short and tall, and dwarf women have brought forth infants as long, when extended, as their mothers. In some cases one limb only is diminutive. Of course, deformities the opposite of these exist, such as giants, or instances

of premature or excessive local growth. O'Byrne, the Irish giant, measured 8 feet 4 inches when he died at the age of 22. Such individuals are generally subject to premature decay. 3. *Deformity as regards shape*.—This results generally from retarded growth, the parts of the embryo not consolidating as growth advances, as in harelip, or from irregular muscular contractions, as in clubfoot (q.v.); or by two or more parts coalescing, as two fingers; or in cyclopy, when both eyes run into one. 4. *Deformities of color* are frequently coexistent with a tendency to, or the presence of, some disease. There may be a deficiency of coloring matter, as in albinos; or an apparent increase, as in cyanosis (q.v.), or "blue disease," arising from the partition between the right and left sides of the heart not being completed; or from pigment abnormally placed in the body, as in the mottled individuals shown in the side shows of circuses. 5. *Deformities of continuity* occur from the lateral halves of the embryo not completely closing, as seen in clefts of the back, the palate, etc. Acquired deformities will be noticed under their special names. Consult Hirsch and Piersol, *Human Monstrosities* (Philadelphia, 1892).

**DEFREGGER**, dă'frég-ër, FRANZ VON (1835–). An Austrian genre and historical painter, widely popular through his delineations of Tyrolese everyday life and of many stirring episodes in the history of his native land. He was born at Stronach, Tirol, April 30, 1835, the son of a peasant, and showed early a talent for drawing and wood carving, which he practiced untutored while tending his father's cattle. His career began late, for he lacked instruction till, in 1860, he went to Innsbruck to study sculpture under Michael Stolz, who, discovering his greater talent for painting, sent him to Munich, where he studied at the Academy under Anschütz. After 18 months spent in Paris (1863–64), with little if any benefit to his art, he returned to Munich in 1866, and in the spring following became the pupil of Piloty, to whose influence he is indebted for his technique. He now also found the sphere in which he was soon to score success after success, such subjects as "Joseph Speckbacher and his Son" (1869, Ferdinandeum, Innsbruck), a patriotic scene of soulful conception, and "Wrestling Match in Tirol" (1870), a spirited representation of this popular sport of his countrymen, being received with great favor, and most of his subsequent efforts finding their way into the principal galleries of Germany. The most noteworthy among these are, "The Last Summons" (1874, Vienna Museum), a stirring episode from the rising of the Tyrolese in 1809; "Return of the Tyrolese Riflemen in 1809" (1876, National Gallery, Berlin); "Andreas Hofer on his Way to Execution" (1878, Königsberg Museum); "Storming the Red Tower at Munich in 1705" (1881, Pinakothek, Munich). But he appears to even greater advantage in his village genre scenes, such as "The Prize Horse" (1872); "The Zither Player" (1876, Vienna Museum); the cleverly ironical "Fashionable Tyrolese" (1882, National Gallery, Berlin); "The Fortune Teller" (1891); "Before the Dance" (1892); and many others that have become widely known through reproductions. In technique they are less attractive, the color being thin and dry, the drawing lacking in naturalistic truth. Keen insight into character

and quaint humor are the main features of his compositions. He passed most of his life in Munich, where he was appointed professor at the Academy in 1878 and was ennobled in 1883. A "Defregger Album," with text by Rosegger, was published in Vienna (2d ed. in 1889–92), and "Vom Land Tirol," a collection of pictures with text by Haushofer, in Munich, 1895. Consult Rosenberg, "Defregger," in Knackfuss, *Künstler Monographien* (Bielefeld, 1897 and 1900), and Meissner, *Frans von Defregger* (Berlin, 1900).

**DEFTERDAR**, dēf'tēr-dār' (Turk. *defterdār*, from Pers. *daftar*, book + *dār*, keeping, holding). A title of the chief treasurer of a Turkish province, as formerly of the Turkish Minister of Finance, who has a seat in the divan (q.v.) and disburses the public money.

**DE FUNIAC SPRINGS**. A city and the county seat of Walton Co., Fla., 79 miles east by north of Pensacola, on the Louisville and Nashville Railroad (Map: Florida, B 6). It is in an agricultural and fruit-growing region which produces cotton, rice, sugar cane, grapes, and peaches, manufactures turpentine, and has also important lumber, poultry, and stock-raising interests. It is the seat of a Presbyterian college, the Thomas Industrial School, and of the Florida Chautauqua Assembly. The water works and electric-light plant are owned by the city. Pop., 1900, 1681; 1910, 2017.

**DE GAMBOA**, P. S. See SARMIENTO DE GAMBOA.

**DE GARMO**, CHARLES (1849–). An American educator, born at Mukwonago, Wis., and educated at the State Normal University, Normal, Ill., and at Halle, Germany. He was professor of modern languages in the Illinois State Normal University (1886–90), professor of psychology at the University of Illinois (1890–91), president of Swarthmore College from 1891 to 1898, and thereafter professor of science and the art of education at Cornell University. He was elected president of the National Herbart Society in 1892 and is considered the leader of the Herbartian school in the United States. Among his published works are: *Herbart and the Herbartians* (1896); *Language Series* (1897); a translation of Lindner's *Manual of Empirical Psychology as an Inductive Science* (1889); *Essentials of Method* (1889, 1907); *Interest and Education* (1902); *Principles of Secondary Education* (1907–10); *Laboratory Exercises in the Art of Appreciation* (1907); *Æsthetic Education* (1913).

**DEGAS**, de-gās', EDOGÉ HILAIRE GERMAIN (1834–). A French genre and portrait painter. He was born in Paris, July 19, 1834, and was a pupil of Lamothe in the Ecole des Beaux-Arts, but learned more from the old masters in the Louvre and in Italy. Though usually classed as an Impressionist, he is in reality an independent, his art having been subjected to several different influences and being, above all else, personal. He at first painted in the manner of Ingres, and was also a great admirer of Delacroix, less for that artist's coloring than for the noble action in his pictures. His softness and fluency of modeling resembled the modeling of Manet, and from the Japanese he learned his absolute freedom of composition, fantastic decoration, and peculiar emphasis. His first works were etchings, portraits, and historical paintings, but he soon turned to genre pictures of modern life. Among

the large variety of subjects which he treated, the best known are his "Race Horses" and numerous "Ballet Girls." The former are distinguished for their fine movement, while the latter were his favorite subject after the seventies. He scoured the slums of Paris in search of picturesque subjects, but still continued, however, to paint portraits, many of which are masterpieces. His color and brushwork are fine. His later work is almost entirely pastel. His composition is daring and original; he does not hesitate to bisect figures, his stage pictures often showing nothing but the heads of the orchestra and the legs of the dancers. Nevertheless his work is very popular in America, where he paid a lengthy visit in 1873, as well as in France. The Luxembourg acquired, as a legacy from the painter Caillebotte, a number of his paintings, including the celebrated "Dancer on the Stage." Degas's pictures now command enormous prices. At the sale of the Rouart collection in 1912 his "Danseuses à la barre" was sold for 435,000 francs, the highest price ever paid in France for the work of a living master. Although Mary Cassatt was his only actual pupil, his influence on the younger generation has been very strong. For his life and works, consult: Liebermann (Berlin, 1899); Moore, in the *Magazine of Art* (London, 1900); Grappe, in *Kunst der Gegenwart* (Berlin, 1908); Lemoine, in *L'Art de notre temps* (Paris, 1912); Meier-Gräfe (Berlin, 1913).

**DE GASPÉ**, de gâs'pâ'. **PHILIPPE AUBERT** (1780-1871) A Canadian author. He was born in Quebec, was educated at the Seminary of that city, studied law, and was admitted to the bar. He became sheriff of Quebec, but fell into debt, for which he was for four years in prison. After his release he went to live on his inherited seigniorial lands at Saint-Jean-Port-Joli. In advanced years he wrote *Les anciens canadiens* (1862), a series of historical pictures (in the form of fiction) of the life and manners of the old régime in the Province of Quebec. His *Mémoires* (1866) narrate his personal recollections of contemporary persons and events with rare fidelity, skill, and discretion. See **CANADIAN LITERATURE**.

**DEGEER**, de-gär', **KARL BARON** (1720-78). A Swedish entomologist, born at Farþang. He was marshal of the household to the Swedish King and was chosen member of the Academy of Sciences at Stockholm. He is known as the author of a great work on the history of insects, entitled *Mémoires pour servir à l'histoire des insectes* (7 vols., 1752-78).

**DE GEER AF FINSPÅNG**, fën'spång. See **GEER AF FINSPÅNG**, **LOUIS GERIARD**, **BARON DE**.

**DEGENERACY** (from *degenerate*, Lat. *degeneratus*, p.p. of *degenerare*, to degenerate, from *de*, down + *genus*, race). The definition given in 1857 by Morel is: "The clearest notion we can form of degeneracy is to regard it as a morbid deviation from an original type. This deviation, even if at the outset it was ever so slight, contained transmissible elements of such a nature that any one having in himself the germs becomes more and more incapable of fulfilling his functions in the world, and mental progress, already checked in his own person, finds itself menaced in his descendants." Morel uses the term to denote the congenital defectives, mental and physical. Degeneracy manifests itself in almost innumerable forms, among which

are deformed skulls, paralysis of members, atrophy of various organs, epilepsy, feeble-mindedness, idiocy. Anatomically speaking, the causes of these are certain lesions of the cerebrospinal axis.

The word "normal" should be understood as having a relative significance. The man is normal who is best adapted to his environment. The normal savage would soon find his way to the almshouse if suddenly transported to civilized life. In primitive life great variations from the normal are soon weeded out by the ruthless action of natural laws. The feeble-minded soon perish without opportunity of propagating their kind. In advanced society, with its higher regard for life, the defective has a chance to live and, if society is sufficiently careless, an opportunity to reproduce. Thus the Jukes, a notorious New York family, might have attracted no attention in a hunting society, but, living in New York in the nineteenth century, they cost the taxpayers millions of dollars besides the indirect harm of their presence and influence of their example. The individual loses power of adapting himself to changed conditions and sinks lower and lower. The question of degeneracy thus becomes of vital importance to society.

Certain forms of degeneracy are relatively of less social importance, as, e.g., minor physical defects, or those monomanias that find expression in strange beliefs, grotesque obsessions, great anguish concerning impossible conditions. Indeed, great deviations from the normal may be accompanied by unusual power in some line, as, e.g., the musical gifts of "Blind Tom." But these may vary, from such incoordinated motor reactions as persistent movements of limbs or face to kleptomania, impulsion to suicide, and homicide. Here the public welfare is again at stake.

The greater degrees of degeneracy are represented by the idiot who merely vegetates. The higher centres are inoperative, the individual totally irresponsible. Among those whose mental functions are in evidence there are still certain physical stigmata. "The cunning look" of the criminal is proverbial. Lombroso and his followers have sought to classify criminals on this basis. The attempt has not wholly succeeded, but Z. R. Brockway, long superintendent of the Elmira Reformatory, has lately stated his growing conviction that criminals are not normal men physically. Society must in some way discover the line between the normal and responsible and the degenerate and irresponsible. It has become clear that there are born criminals, moral imbeciles. There is a difference between the erotic and the immoral man, the kleptomaniac and the thief, the homicide and the assassin. Not until these facts are understood will there be a scientific treatment of the individual who errs.

It is a great misfortune that a man should be born deaf, epileptic, or feeble-minded. It is something more than a misfortune if he is allowed to grow up and transmit his defects. When it is found that children of deaf parents are likely to be deaf, those of the epileptic to have epilepsy, and the offspring of the feeble-minded to resemble their parents, society must call a halt. Without any greater knowledge of the field than we now have, it is plain that this is the first step to take.

The immediate cause of degeneracy may be

either individual or social, though the final causes are often beyond our ken. In present society sexual immorality is a fruitful source of degeneracy. All attempts to regulate it have been futile. Of the effect of this vice there has been far too little study. In the best study extant, "The Jukes," Dugdale says: "Fornication, either consanguineous or not, is the backbone of their habits, flanked on the one side by pauperism, on the other by crime. The secondary features are prostitution with its complement, bastardy, and its resultant, neglected and miseducated childhood; exhaustion with its complement, intemperance, and its resultant, unbalanced minds; and disease with its complement, extinction." Another great cause is intemperance, though the extent of this is often overstated. "It is at once an effect and cause, a symptom and a source of degeneration." Laziness with its complement, idleness, is likewise a potent factor. Among social causes are enforced idleness, accident with its resultant loss of employment, dangerous employments, unhealthful housing conditions, producing weakness tending to dissipation and vice. These causes are perceptible, can be got at, and to a large measure be destroyed. The attempts of Nordau and others to class the genius with the degenerate have not succeeded. See DEGENERATION AS A FACTOR IN EVOLUTION, EUGENICS.

**DEGENERATION** (Fr. *dégénération*, from Lat. *degenerare*, to depart from one's race, to degenerate, from *de*, away + *genus*, stock, race, family). In pathology, a term applied to certain tissue changes of a retrogressive character, which are associated with various conditions resulting from age, malnutrition, infectious diseases, poisons, etc. The degenerative process may assume several forms, which have been named from their special characteristics. Parenchymatous degeneration, or albuminous degeneration, is the type which most often accompanies the infectious diseases. While any of the cells of the body may be affected, those of the liver, kidney, and the epithelial cells of the mucous membranes suffer most frequently; the cells become swollen, more granular than normal, and may go on to disintegration. Fatty degeneration is the term used to designate a process by which the protoplasm of the cells of various organs is converted into fat droplets. Under certain conditions tissues, especially those in the walls of blood vessels, are converted into a homogeneous transparent substance; this form of degeneration is called either hyaline degeneration or amyloid degeneration, according to the microchemical reaction of the substance. Amyloid degeneration is also known as waxy or lardaceous degenera-

tion. The term "mucoid degeneration" is used to designate a form affecting both cells and intercellular substance, and in which the protoplasm is transformed into a translucent substance containing mucin. A similar condition in which the new material is more dense and firm is known as colloid degeneration. Under certain conditions granules of lime cells are deposited in the tissues and may be so abundant as to make the tissue hard and brittle or even bony; the condition thus produced is known as calcareous degeneration, or infiltration.

**DEGENERATION AS A FACTOR IN EVOLUTION.** The progressive development of organic forms is from the beginning attended by the modification of organs or of the organism, through lack of nutrition or disuse, resulting in physical degeneracy. We see everywhere throughout the plant and animal kingdoms this process of degeneration, this loss or reduction of parts of organs or entire organs. This is proved by the occurrence of so many vestigial organs or structures in the higher or more specialized plants, and especially animals, as compared with the stem forms, i.e., the ancestral or generalized forms from which they have apparently descended.

Indeed, there can be no specialization of form and structure without a corresponding reduction of the less useful neighboring parts by partial or total atrophy. To illustrate: The foot of the horse, so wonderfully adapted to the animal's mode of life, consists of a single digit, the other four having disappeared, with the exception of the two splint bones, which are the relics of two digits. Morphology and paleontology declare in unmistakable terms that the ancestral form from which the horse family has descended was a generalized form provided with five functional toes on each foot. See HORSE, DISUSE.

In groups of animals with a metamorphosis there are exceptional forms in which development is direct, the stages of development being abbreviated or suppressed; the organism may then be taken to take a "short cut" to attain a growth on a level with its allies, who have traveled the long road of development by metamorphosis.

The evolution of almost every type, as well as the process of development of the embryo of most organisms, particularly of the more specialized animals, is a process of development of one part at the expense of another, its hypertrophy, due to accelerated development, resulting from use or exercise and consequent increased nutrition; while adjoining parts, or less desirable or useful parts or organs, are allowed to remain stationary or lapse by atrophy. Adaptation seems not only to involve progressive evolution, but also degeneration. Thus there appears to be in the growth of the individual as well as in the development or evolution of the race or class, a competition or struggle for existence, at first between the cells and afterward between the different organs, especially those most concerned with the outer world or with competitive organic forms. The result is that the successful structures receive the most nourishment, while the less useful or favored languish and dwindle, becoming so many vestiges to tell the tale of defeat and death by atrophy.

This is exemplified in the case of such an animal as the lobster. In this animal and

throughout the class of Crustacea, of which it is a type, the wonderful diversity of form in the segments of which the body and limbs are composed, as well as the marvelous degree of specialization of body and limbs characterizing the thousands of species of the class, are due to the excess of development of one over adjoining parts. Thus the huge carapace or shield of the lobster is due to the excessive development of the upper or dorsal portion of two head segments, the corresponding parts or arches of 11 other segments of the cephalothorax having during the growth of the animal become completely lost or atrophied by the continuous pressure of the growing carapace.

The wonderful differences between the mouth parts of the caterpillar and the butterfly are due to the normal or, in some cases, excessive development of one pair of organs at the expense of others. Thus the mandibles of the caterpillar undergo atrophy in the changes of the chrysalis to the butterfly; the latter, taking no solid food, has entirely lost its mandibles, while the maxillæ forming the tongue are, by exercise in taking nectar, greatly developed, as in the butterfly and especially in the hawk moth.

So it is with man. As regards his brain and hands he is the most specialized of mammals, but as concerns his feet he is plantigrade, showing a tendency to loss of his little toe by atrophy, while already in the higher race he loses his wisdom teeth soon after they appear. Besides this he bears the vestiges of nearly 70 useless structures, among them the vermiform appendix, the most useless and positively dangerous of these relics pointing to his origin from some more generalized mammal.

The case is similar with the paddles of the ichthyosaurus, the plesiosaurus, and the whales. They are, at least in the last named, the result of modification by degeneration, resulting in adaptation to the medium inhabited. And so it is with the process of evolution of the birds, pterosaurs, and bats, and the modifications in the feet of the mole, and in the burrowing insects, climbing lizards, mammals, particularly the lemurs, and the thumbless monkeys.

There are four chief forms of degeneration: (1) degeneration during the growth of the individual, and the phylogeny of the race or class; (2) degeneration of the individual, more or less total; (3) social and institutional degeneration, often affecting whole peoples, due to slavery, and to mental, moral, and pathological causes; and (4) individual moral degeneration in the human races, resulting in the production of mental degenerates and criminals. It is worthy of observation that the occurrence of atrophy, of degeneracy in man, is nearly everywhere foreshadowed in the rest of the organic world, where it is a normal process, and the necessary complement of progressive evolution.

The death or elimination of the individual member which has become useless or out of harmony with its physical and social environment is also in the course of nature. When once lapsed by atrophy, an organ or part of an organ can never, as a rule, be restored; there are a few exceptions, e.g., that of the pigment of a blind *Proteus* subjected to light, and the organs of certain plants. The process of degeneration may at an early stage be arrested, but after a certain stage resumption of the original normal structure becomes impossible. Were it not so, evolution would be vastly less

progressive than it has been, and the world would be crowded more densely than now with degenerates.

The immediate causes of degeneration are lack of nutrition, disuse, and change of habit and instincts, so that an organ or set of organs are thrown out of use. Atrophy, also, as stated by Demoor, may arise from lack of space, as seen in the reduction in the number of teeth in man compared with lemurs and platyrrhine monkeys, these having six grinding teeth, while man has but five, due to a reduction in the size of the jaw.

Not only do we observe sporadic cases of degeneration, but also species and genera, as well as families, are made up of forms in different stages of degeneration. All parasites, entire classes, as that of sponges, and two classes of worms, as the Trematoda and Cestoda, the crustacean class Cirripedia or barnacles, and the parasitic fish lice, as well as the parasitic isopods (Bopyridæ), and many insects owe their characteristics to degeneration, while the great order of Diptera are all highly modified by the atrophy of certain parts, their most obvious features being the reduction of the second pair of wings so as to form the "balancers." (See FLX) The forerunners of the true vertebrates, the tunicates, afford a notable instance of the retrogressive development of an entire class.

Enough has been said to show how very general throughout the animal kingdom is modification by partial or total atrophy. The study of animals thus affected throws a flood of light on the factors and causes of progressive evolution.

In mankind degeneration on a wholesale scale is observed in the effects of slavery and of the slave trade in Africa, where it has been carried on for centuries, and on the master races. The result is that the white race is in a degree pulled down or deteriorated. A parallel is observable in ant societies, where the service rendered by the enslaved tends to disuse and atrophy in the masters.

In the social evolution of man the joint work of Demoor, Massart, and Vanderville gives a multitude of facts proving that, as among organisms in general, so in human societies, evolution is at once progressive and retrogressive. Existing social forms have during the process of change and modification lost some parts of their structure, and this process of degeneration cannot be regarded as a return to the primitive condition of man. Thus, (1) an institution which has once disappeared in the course of human development never reappears; also, (2) an institution once reduced to the condition of a vestige cannot be reestablished and resume its former functions; (3) neither can it assume fresh functions. While in the organisms below man degenerative evolution is brought about by a limitation of nutriment, in sociology the cause is a limitation in capital or labor. An institution which has ceased to be functional or useful may survive. These survivals exist here and there, and as Houzeau has said, "it is to be expected that living and superior civilizations drag behind them a trail of débris from dead civilizations." All this has the most significant bearing on human degeneracy and the study of criminology, especially as to the existence of those pathological, mental, and moral degenerates that appear to live only to afflict struggling humanity.

There are degenerate races, as the Austrians, a probable branch of the Dravidian stock of India; the Gypsies, a broken down low-caste Indian people; the Fugians, a tribe segregated from the American Indian race. There are also scattered through the most highly developed civilizations physical, mental, and moral degenerates, of which families like that of the James brothers of Missouri, the Jukes of the State of New York, or assassins like Booth, Guiteau, and certain Nihilists are examples.

Vanderville, *Evolution by Atrophy in Biology and Sociology* (New York, 1899); Morel, *Traité des dégénérescences physiques, intellectuelles, et morales de l'espèce humaine* (Paris, 1857); E. S. Talbot, *Degeneracy: Its Causes, Signs, and Results* (New York, 1898). See DEGENERACY and consult the works there referred to.

**DEGER**, dā'gēr, ERNST (1809-85). A German religious painter. He was born at Bockenem, near Hildesheim; studied first at the Berlin Academy under Wach, and then under Schadow at Düsseldorf. Deger was the leader of the Düsseldorf religious painters, who imitated the so-called Nazarenes (see PRÆRAPHÆLITES). He showed more true feeling for beauty and color and less affectation than the contemporaries of his school. In 1837 Count Fürstenberg intrusted him with the decoration of the newly built church of St Apollinaris, near Remagen on the Rhine, of which he painted the frescoes in the choir, considered the greatest achievement of the Düsseldorf school in that field. They include the "Crucifixion," the colossal figure of the Redeemer, with the Madonna and John the Baptist on either side, and scenes from the life of Christ. Deger was next commissioned by King Frederick William IV to decorate the chapel in the castle of Stolzenfels, near Coblenz, where he painted 12 frescoes, representing the fall of man and the redemption. After 1869 he was professor at the Düsseldorf Academy. His last important work was "The Resurrection," in the Maximilianum, Munich.

**DEGÉRANDO**, de-zhā'rān'dō', JOSEPH MARIE, BARON (1772-1842). A French philosopher, born in Lyons. In 1797 he went to Paris, whence after the 18th Fructidor he fled to Germany. After his return he was Secretary General in the Ministry of the Interior in 1804, and a Councilor of State in 1811. His *De la génération des connaissances humaines* (1802) was crowned by the Academy of Berlin, and his *Histoire comparée des systèmes de philosophie* (2 vols., 1806-07) remains one of the most important of French works on the subject. His *De la bienfaisance publique* (4 vols., 1839) should also be mentioned as among the most elaborate treatises on poor relief.

**DEGGENDORF**. A town of Lower Bavaria, Germany, situated on the Danube, 30 miles northwest of Passau (Map: Germany, E 4). It is a manufacturing town with woolen mills, breweries, tanneries, and corn mills, and is a busy corn and cattle market. Its chief points of interest are the church of the Holy Sepulchre, built 1337, a pilgrim resort, the scene of reputed miraculous cures, and a Gothic rathaus built in 1535. Pop., 1900, 6843; 1910, 7478.

**DE GOEJE**, dā gō'ye, MICHAEL JAN (1836-1909). A Dutch Arabist. He was born at

Drontryp, Friesland, and was a pupil of the distinguished Arabic scholar Dozy at the University of Leyden (1854-60). In 1866 he was appointed to the professorship of Arabic at the University of Leyden, and from 1862 to 1878 was prominently engaged as an inspector of schools and promoter of education in Holland. He was editor of a new edition of *Tabari*, and continued the catalogue of Oriental manuscripts begun by Reinhart Dozy. De Goeje was generally regarded as the greatest Arabic scholar of his generation in the western world. Among his numerous publications are the following: *Jakubi*, a description of Africa and Spain; *Beladhori*, a history of the conquest of Syria; the geographical works of Istakhri, Ibn Haukal, Mokaddasi, Ibn al-Fakih, Ibn Khordadbeh, Ibn Rosteh, and al-Masudi (in the *Bibliotheca Geographorum Arabicorum*, 1870-94); the *Dwan* of the poet Moslem Ibn al-Walid; *Biographie de Reinhart Dozy* (trans. by Chauvin, 1883); "A Contribution to the History of the Gypsies," in proceedings of *Koninklijke Akademie van Wetenschappen*, Eng. trans. by Snyders (London, 1886). Consult *Untersweg*, *Michael Jan de Goeje* (Graz, 1909), and Snouck Hurgronje, *Levensbericht van Michael Jan de Goeje* (Amsterdam, 1910).

**DÉGRAS**, dā grā'. A wool grease obtained in the process of oil tanning of skins and hides and also from the waters used in wool scouring. See LEATHER.

**DE GRASSE**, de grās', COUNT. See GRASSE, COUNT DE.

**DEGREE**' (in mathematics). See ANGLE, 'IRCLE.

**DEGREE**. An academic rank or title, originating in the mediæval universities. Scholastic distinctions of an analogous nature seem to have existed in ancient times. The ancient Greek doctors or teachers of the law (*nomodidaskaloi*) and the scribes of the Jews were products of an organized educational scheme and possessed privileges similar to those conferred by the degree of a teaching doctor in the Middle Ages. In the latter part of the classical Greek period education was well organized into inferior and superior courses, and there evidently existed some recognized proof that such courses had been completed. Greek educational institutions and practices were imitated by the Romans, and Constantinople, Alexandria, and Rome vied with Athens in the support of schools offering elaborate and definite courses of study, the completion of which carried certain distinctions comparable to the modern degree. Historically, however, there is no connection between them. The degree as a university distinction originated at Bologna and Paris during the twelfth century, and, as the titles "master" and "doctor" imply, signified at first nothing more than a license to teach. Thus, at the University of Paris in its earliest days, the instructors taught by virtue of a *licentia docendi* issued by the chancellor of the cathedral on the Ile de la Cité. This gave them the right to the title of master, the advance from their previous academic rank of bachelor being symbolized by the ceremony of placing the *biretta*, or cap of office, upon their heads by their former instructors.

Of the different university degrees, that of master came first in point of time, being conferred in the twelfth century by the various faculties of the universities in both France and

Italy. The title "doctor," as an honorary distinction, is not infrequent at this time, usually coupled with some qualifying word: e.g., Thomas Aquinas, Doctor Angelicus. For some time, however, the titles of master, doctor, and professor were used indiscriminately. In the fifteenth century the doctor's degree had quite generally replaced the master's in the faculties of law, medicine, and theology, while the master's degree still held its own in the faculty of arts. In the fourteenth century, when many universities began to be founded by virtue of special *privilegia* granted by pope or emperor, the right to bestow the doctor's degree was often specifically granted and in some cases was withheld. Usually, however, the founding of a university implied the right to confer degrees. Both the Pope and the Emperor had the power to confer the honorary title of doctor, or to delegate this power to others, and the doctors thus created were known as *doctores bullati*, in distinction from the *doctores rite promoti*, those who had successfully undergone the test of the disputation. A candidate for a degree was required to prepare and read a Latin thesis, which he had to defend against a doctor of the faculty, three opponents specially appointed, and, as the phrase ran, "against all comers." Disputations, which formed one of the most brilliant and picturesque features of mediæval university life, continued down to a comparatively late period. In England they were not wholly done away with until 1860. The degree of bachelor was first brought into use in the thirteenth century, at the University of Paris and elsewhere, to designate students who had passed certain preliminary tests. In the faculty of arts, where the term of study was shortest, it was of comparatively little importance. In Paris, in the fifteenth century, the required period was four years in the faculty of arts, seven years in law, eight in medicine, and 14 in theology; and in these longer courses the preliminary degree conferred certain valuable privileges. The later history of degrees varies somewhat in different countries. Thus, in Germany the doctorate is practically the only degree conferred by universities and has been extended to other faculties than philosophy, which is the most common. In France the *baccalauréat* in letters and science is not a degree conferred by the university in the technical sense, but is obtained on completing a course corresponding largely to that of secondary schools elsewhere. In Scotland the first university degree is the M.A., the ancient tradition thus being retained. In the English universities the three degrees—bachelor, master, and doctor—are found. The doctor's degree is, however, not frequently obtained in course, the majority of those holding it being in the field of medicine, science, music, or theology.

**Degrees in the United States.** At the present time there is a regrettable lack of uniformity throughout the whole system of degrees granted by institutions of learning in the United States. Institutions claiming the right to confer university degrees have multiplied so rapidly within recent years, and there is frequently so wide a disparity in their standards, that the value of a degree is a highly variable quantity. To some extent, however, there is a tendency towards uniformity of standards, a movement fostered by numerous college and university associations and by such bodies as the Carnegie Foundation (q.v.). In general, it may be said that the lowest, or

bachelor's degree, stands for four years of college work; that the second, or master's degree, is granted after not less than one year of specialized study in a graduate department; and that the doctor's degree is bestowed after two or three years of specialized study and the preparation of a thesis upon some subject approved by the faculty. Even among the older universities and those of the highest standards there is considerable divergence in the significance of the several degrees. That of A.B., for instance, no longer stands, as it once did, for a definite amount of Latin and Greek and mathematics. The steady growth of the elective system and the tendency to substitute modern languages for the classics have forced upon the universities the alternative of either changing the requirements for the degree or else conferring a different degree in place of it. Latin and Greek are still required subjects for the A.B. degree at Ohio University, University of Vermont, Princeton, Rochester, Syracuse, Amherst, Franklin and Marshall, and Lafayette, while Latin is still required in many of the Southern colleges and universities, and Western Reserve, Mount Holyoke, Bates, Williams, Pennsylvania, and a few others. The tendency is more and more to extend the elective system, to recognize the value of new subjects, and, if any subject is to be prescribed, to select English. Most American colleges offer several parallel courses, leading to the degrees of A.B., B.L., B.P., and B.S., and in these institutions there are usually corresponding master's degrees—M.A., M.Lit., M.Ph., and M.S. In the faculties of medicine, law, and theology there is not the variety of degrees found in the faculties of philosophy and science. The medical schools regularly grant the doctor's degree alone, while the divinity and law schools usually give only the bachelor's degree. The higher legal degrees, however, are granted by just a few law schools, such as Yale, which confers the degrees of LL.M. and D.C.L. as the result of certain required studies, and the University of Chicago, which already confers the degree of J.D. The indiscriminate and ill-advised bestowal of honorary degrees is another cause that contributes to lessen the value of American degrees. Not only those degrees which are properly honorary, such as the D.D. and LL.D., are often bestowed by smaller colleges upon insufficient grounds, but other degrees which should regularly be won only by a definite course of study are conferred as honorary degrees, such as the Ph.D., the M.A., and even the bachelor's degree. Recently, however, a reaction has set in, and steps are being taken to check the granting of degrees out of course excepting such as are generally recognized as honorary degrees. See BACHELOR'S DEGREE; DOCTOR; DOCTORS OF THE CHURCH; ELECTIVE STUDIES. MASTERS OF ARTS; UNIVERSITY.

#### LIST OF THE MORE USUAL DEGREES

- A.A., Associate of Arts
- A.B. or B.A., Bachelor of Arts.
- A.M. or M.A. (*Artium Magister*), Master of Arts
- B.C.L., Bachelor of Civil Law
- B.D., Bachelor of Divinity
- B.L. or Litt.B., Bachelor of Letters
- B.LL. or LL.B. (*Legum Baccalauræus*), Bachelor of Laws.
- B.P., B.Ph., or Ph.B., Bachelor of Philosophy.
- B.S. or B.Sc., Bachelor of Science
- C.E., Civil Engineer.
- C.M. (*Chirurgia Magister*), Master in Surgery
- D.C.L., Doctor of Civil Law.
- D.D., Doctor of Divinity.
- D.Litt. or Litt.D., Doctor of Literature.
- D.M., Doctor of Medicine (Oxford).

D.M.D. (*Dentaria Medicina Doctor*), Doctor of Medical Dentistry.  
 D.V.M., Doctor of Veterinary Medicine.  
 D.S. or D.Sc., Doctor of Science.  
 E.E., Electrical Engineer.  
 J.D. (*Juris Doctor*), Doctor of Law.  
 J.U.D. (*Juris Utriusque Doctor*), Doctor of Civil and Canon Law.  
 L.H.D., Doctor of Letters, or Humanities.  
 LL.B. (*Legum Baccalaureus*), Bachelor of Laws.  
 LL.D. (*Legum Doctor*), Doctor of Laws.  
 LL.M. or M.L. (*Legum Magister*), Master of Laws.  
 M.B. (*Medicine Baccalaureus*), Bachelor of Medicine.  
 M.C.E., Master of Civil Engineering.  
 M.D. (*Medicina Doctor*), Doctor of Medicine.  
 M.M.E., Master of Mining Engineering.  
 M.M.B., Bachelor of Music.  
 Mus.D., Doctor of Music.  
 Ph.D. (*Philosophia Doctor*), Doctor of Philosophy.  
 Ph.G., Graduate in Pharmacy.  
 V.S., Veterinary Surgeon.

The origin of a special costume to designate members and graduates of universities is obscure and probably was not in the first instance at all formal or conscious, but a mere adaptation of monastic costume. In the days when it was first used long and flowing robes were commonly worn by all classes of people, the university, like the Church, only preserved a tradition which died out in the world. The advantages of a distinctive costume were probably recognized at an early date. Two of the most obvious are the equalization of rich and poor under a simple uniform gown, and the provision of a means of identifying students. This latter view probably counts for something in the rule still in force at Oxford and Cambridge, which forbids undergraduates to appear in the streets without academic costume in the morning or evening. Gowns were at first all black, but distinctions of social rank were later expressed by them, and the sons of noblemen in England were permitted in the thirteenth century to wear gowns of any color. A skullcap was allowed to ecclesiastics to protect the tonsured head, and, except the hood, this is the only headdress recognized by early university statutes. This *pileus* soon assumed a pointed shape, and in this form was recognized as one of the insignia of the doctorate. The central point developed afterward into the modern tassel. Bachelors wore no official head-dress. The hood, which was worn by undergraduates until the sixteenth century, was originally attached to the gown, like the cowl of the monastic habit. Later it became a separate article of dress, which by its shape or color denoted the academic rank of the wearer. The English and Scottish universities have long maintained a definite system of hoods, which differ in each institution. Thus the bachelor's hood in Oxford and Cambridge is trimmed with white fur; the M.A. hood of Oxford is lined with crimson, and at Cambridge with white silk. the Oxford D.D. is of scarlet cloth lined with black, the Cambridge of scarlet lined with pink, the Oxford D.C.L. of scarlet cloth lined with crimson silk, the Cambridge LL.D. with pink silk. Clergymen who are literates—i.e., ordained without an academic degree—are allowed to wear a hood or tippet of plain black silk over their surplices. Gowns are not worn by undergraduates in the German universities—in fact, they are practically appropriated to the rector and deans of faculties and by them worn only on the most solemn occasions.

The wearing of cap and gown in America was comparatively rare until the last quarter of the nineteenth century. A movement towards a general adoption of a uniform system resulted in

the calling of an intercollegiate commission, which met in 1894 at Columbia College, under the chairmanship of President Low, Yale, Princeton, and New York University being also represented. Their report, made a year later, was adopted by many colleges, as offering a simple, adaptable, and intelligible system. It provides for three types of gowns and of hoods—for bachelors, masters, and doctors. The bachelor's gown has long pointed sleeves; the master's a long closed sleeve, square at the end, falling below the knee; the doctor's resembles the familiar pulpit or judge's gown, with full, round, open sleeves, and is faced with velvet, of which it also bears three bars on the sleeves. The two latter are of silk, the bachelor's of worsted stuff. These distinctions in gowns follow closely the English usage; the system of hoods is a piece of original constructive legislation, there being three distinct forms for bachelor, master, and doctor, lined with silk of the official colors of the institution granting the degree, and trimmed with velvet of the color that represents the department of learning in which it is conferred. The following are the colors used for this purpose: arts and letters, white; theology, scarlet, laws, purple; philosophy, blue, science, gold yellow; fine arts, brown; medicine, green, music, pink; pharmacy, olive; dentistry, lilac; forestry, russet; veterinary science, gray, and library science, lemon. In connection with this system it is customary for those who hold degrees from German universities to line their hoods with the colors of the university granting them, upon which is laid a German tri-chevron of black, white, and red. Consult H. Rashdall, *Universities of Europe in the Middle Ages* (Oxford, 1895); A. O. Norton, *Medieval Universities* (Cambridge, Mass., 1909); J. Wells, *The Oxford Degree Ceremony* (Oxford, 1906). See Colored Plate with article UNIVERSITY.

**DEGREE OF LATITUDE.** The distance along a meridian (q.v.) through which an observer must pass to alter his latitude (q.v.) by 1°, i.e., in order to see a star in the meridian 1° nearer to or farther from the zenith. The length of a degree must be calculated from data found by actual measurements on the earth's surface; and, owing to the earth being an oblate spheroid and not a sphere, it varies with the place of observation, the degrees being longer towards the poles, where the earth is flatter, and shorter at the equator, where the earth is more curved. If the earth were a sphere, a degree would have a constant length. As it is, a degree at the equator contains 362,756.5 feet, while at lat 40° it is increased to 364,283.7 feet. From a variety of observations conducted at various times and places, from as far back as the time of Eratosthenes (about 225 B.C.), tables have been constructed showing the length of degrees at different latitudes. The length of "the middle degree," as it is called, or that of places in lat. 45°, is 364,606.0 feet. The ascertained difference between degrees of latitude is one of the proofs of the earth's spheroidicity. See GEODESY.

**DEGREE OF LONGITUDE.** The distance between two meridians of longitude that make an angle of 1° at the poles, measured on the arc of a circle parallel to the equator. It is clear that this distance is greatest at the equator and becomes zero at the poles; and it can be shown that it varies with the cosine of the latitude,

if the earth be regarded as a sphere. The annexed table shows the lengths of a degree of longitude for every tenth degree of latitude from 0° to 70° and takes account of the earth's divergence from a spherical form.

Latitude	Length of degree in feet	Latitude	Length of degree in feet
0°	365,228.6	40°	281,173.5
10°	359,716.7	50°	235,232.3
20°	343,338.5	60°	183,079.8
30°	316,565.3	70°	125,290.4

**DEGREES, LAMBETH.** By Act of Parliament in the twenty-fifth year of Henry VIII sundry powers formerly belonging to the Pope were conferred upon the Archbishop of Canterbury, among which was the right of granting all the degrees taken in the universities of Oxford and Cambridge, and to this day he occasionally grants them, *honoris causa*. They are known as Lambeth degrees, from Lambeth Palace, London, his official residence.

**DE GROOT.** See HOFSTEDÉ DE GROOT.

**DE HAAS,** de hās, MAURICE FREDERICK HENDRICK (1832-95). A Dutch marine painter. He was born in Rotterdam and studied at the Academy there and later under Louis Meyer at The Hague. In 1859 he emigrated to New York, where he soon gained a high reputation. He was one of the original members of the American Society of Painters in Water Colors, in 1866, and in 1867 became an academician. His best-known American picture is "Farragut Passing the Forts." Some of his other pictures are "Storm Off the Isle of Jersey," "After the Wreck," "White Island Lighthouse," and "The Rapids Above Niagara." His treatment is vigorous though formal, and his effects are often brilliant.—His brother, WILLIAM FREDERICK (1830-80), settled in New York in 1854 and also distinguished himself as a marine painter. He painted "Sunrise on the Susquehanna," "Fish-Boats off Mount Desert," "Evening at Halifax," and "Narragansett Pier."

**DEHISCENCE** IN PLANTS. The opening of structures to discharge their contents: as, e.g., the opening of anthers to discharge pollen, the opening of spore cases to discharge spores, or the opening of fruits to discharge seeds.

**DEHLI.** See DELHI.

**DEHMEL,** dā'mēl, RICHARD (1863- ). A German poet, born in Wendisch-Hermsdorf, the son of a forester. He studied at the University of Berlin, where he edited student journals and took his doctor's degree in 1887 for a thesis on insurance. For the next eight years he was employed by the German Association of Fire Insurance Companies. He traveled in different parts of Europe in 1899-1902 and 1908. He wrote a novel, *Lebensblätter* (1895; 4th ed., 1909), some essays, *Betrachtungen* (3d ed., 1909), but his most distinctive work was in poetry, especially lyric, of the school of Lilien-cron. He has been styled a hedonistic Nietzschean. His writings were collected in a ten-volume edition (1906-09) and in a "popular" three-volume edition (1913); and a volume of selections appeared in 1905. The more important titles are: the symbolical *Erlösungen* (1891, 4th ed., 1906); *Aber die Liebe* (1893, 1896); *Der Mitmensch*, a drama (1895); *Weib und Welt* (1897; 4th ed., 1907). *Lucifer*, a

pantomime (1899); *Fitzebutze*, a juvenile written with his wife, Paula (1900; 15th ed., 1901); *Zwei Menschen*, i.e., man and woman (1903; 10th ed., 1908), an epic, in form derived apparently from French *vers libre*; *Der Kindergarten* (3d ed., 1908) and, also juvenile *Der Buntscheck* (5th ed., 1906); the erotic *Verwandlungen der Venus* (3d ed., 1907); *Michel Michael* (1911), a comedy which has been styled an attempt at a German *Peer Gynt*; *Schöne, wilde Welt* (1913), new poems and proverbs. Consult chap. iii of O. E. Lessing's *Masters in Modern German Literature* (Dresden, 1912) and Kunze, "R. Dehm-el," in *Westermanns Monatshefte*, December, 1913.

**DEHN,** dān, SIEGFRIED WILHELM (1799-1858). A German musical theorist, born at Altona. He became favorably known through his editions of the works of Orlando Lasso (*Seven Penitential Psalms*, 1838) and other early composers. He was custodian of the musical department of the Royal Library, Berlin, after 1842 and in 1849 was appointed professor. Among his numerous distinguished pupils in musical theory were Kiel, Glinka, Rubinstein, Cornelius and Theodor Kullak. His principal publication is the *Theoretisch-praktische Harmonielehre* (2d ed., 1858).

**DEHODENCO,** dā'o'dānk', EDMÉ ALFRED ALEXIS (1822-82). A French genre, portrait, and historical painter, born in Paris. He studied at the Ecole des Beaux-Arts under Léon Cogniet and spent ten years in the East. His reputation rests principally upon his Spanish and Oriental pictures, and he is one of the most original of the group of French painters who treat such subjects. His pictures are notable for ethnographical accuracy, vivacity, and glowing color. In this genre are: "A Bull Fight in Spain" (1850, Pau Museum). "Gypsies on the Road" (1853); "A Jewish Fête at Tangiers" (1865, Poitiers Museum); "A Story-Teller of Morocco" (1878). After his return to France he painted his "October Morning" (1872), an attempt to treat a Parisian scene with the brush of an Orientalist. He also painted a number of portraits, including the painter Debras and Théodore de Banville, and scenes from French history, such as the intensely dramatic "Arrest of Charlotte Corday" (Louvre). Consult his *Biography* by Séailles (Paris, 1885).

**DE HOND,** PIETER. See CANISIUS.

**DEHORNING** (a word of hybrid formation, from Lat. *de*, away from + Eng. *horn*). The practice of dehorning cattle has been in vogue in Europe and the United States for many years. From time to time there has been much controversy as to the advisability and alleged cruelty of the operation. Dehorning is quite generally advocated by all who have tried it. Special dehorning shears or clippers have been devised which enable the operator to remove the horns quickly and with a minimum amount of pain. The animals recover from the operation in a few days without serious loss of flesh or decrease in milk production. Dehorned animals are much less liable to injure one another, especially in transportation. Cattle with quarrelsome or vicious disposition are rendered docile and gentle. The operation should be performed in mild weather and not during periods of extreme cold or in fly time.

The growth of horn may be entirely prevented by the application of caustic potash to the horn button as soon as it can be discovered on the

calf's head, or about three or four days after birth. In applying caustic potash the hair should be clipped from the head so as to expose the developing horn. The latter may be moistened with ammonia, so as to dissolve the oily skin secretion. A stick of caustic potash should then be moistened in water and rubbed on the horn. The operation should be repeated until the horn becomes somewhat sensitive. The process requires only a few minutes. A scab forms over the treated surface, and falls off after a period of about one month, leaving a smooth poll on which the horns never develop.

**DEHRA**, dē'ra. The capital of a district of the same name in the United Provinces, British India, 75 miles east of Ambala (Map: India, C 2). It is picturesquely situated in a mountain valley at an altitude of 2300 feet. Its principal buildings are the seventeenth-century temple of Guru Ram Rai, founder of the town and also of a sect of Ascetics called Udasi; an Anglican church, and an American Presbyterian mission establishment. The town is the seat of district staff officers, of a government survey, and of a forestry school. It is also headquarters for the Imperial Cadet Corps. The city has no manufactures, but is a trade centre. Pop., 1901, 28,095; 1911, 38,610.

**DE'IANTRA** (Gk. Δηιάνερα, *Dēianeira*). In Greek mythology, the daughter of (Eneus, King of Calydon in Etolia, and of Althæa. She became the wife of Hercules (q.v.), who was victorious over Achelous in a contest for her possession, and bore him a son, Hyllus. She unintentionally caused Hercules' death.

**DEI GRATIA**, dē'i grā'shī-ā (Lat., by the grace of God). A formula found a number of times in the epistles of the New Testament. Pope Felix II, in 358, is said to have used *per gratiam dei episcopus*. It was formally used by the bishops at the Council of Ephesus in 431. Later it was commonly used by archbishops, bishops, abbots, and others in their correspondence. After the middle of the thirteenth century, when the sanction of the Pope was considered important for an ecclesiastical appointment, the higher clergy wrote *Dei et Apostolicæ Sedis Gratia* ('by the grace of God and of the apostolic see'). Other expressions were also used, as *Christi nomine, miseratione divina, permissione divina*, etc. In England the usage was largely dropped about the time of the Reformation. Occasionally, however, the archbishops of Canterbury and York used the form until the seventeenth century. The expression is said to have been used by temporal princes as early as the seventh century, but most of the documents with this formula have been proved to be forgeries. From the time of Charles the Great the form was commonly used by the Frankish kings. It was used by all the French kings, except Louis Philippe, from Louis VII to Napoleon III. Charles VII of France regarded the use of *Dei Gratia* as a royal prerogative and forbade its use by the Count d'Armagnac. The phrase is used on coins of many nationalities.

Consult Giry, *Manuel de Diplomatie* (Paris, 1894).

**DE IMITATIONE CHRISTI**. See KEMPTIS. THOMAS A.

**DEINHARDSTEIN**, dīn'hārt-shtīn, JOHANN LUDWIG (1794-1859). A German dramatist, born and educated in Vienna. He was vice director of the Hofburg Theatre, Vienna, from 1832 to 1841, and editor of the *Jahrbücher der*

*Litteratur* from 1829 to 1851, during which period this publication counted among its contributors men like W. von Humboldt, A. W. Schlegel, Rückert, and Hebbel. His *Künstlerdramen* (2 vols., Leipzig, 1845), treating of the dramatic episodes in the lives of artists and actors, may be said to have established in some respects a new dramatic genre in Germany. Among his best plays may be mentioned *Hans Sachs*, *Floretta*, and *Garrick in Bristol*. His collected works were published in Leipzig (7 vols., 1848-57), under the title *Gesammelte dramatische Werke*.

**DEI'NOTHERIUM**. See DINOTHEBIUM.

**DEI'OCES** (Lat., from Gk. Δειός, *Deiōs*). According to Herodotus, i. 96 ff., the first ruler of the Empire of the Medes. After the Median revolt from Assyria he rose to be judge of his own village. The justness of his decisions won surrounding villages to him. Presently the Medes combined and made Deioeces King. For a criticism of this story, for the most part unhistorical, see the editors of Herodotus, e.g., How and Wells, vol. i, pp. 104, 383-384 (Oxford, 1912). He built Ecbatana and, changing his ways, ruled, in true Eastern style, by means of informers and spies.

**DEIOT'ARUS** (Δειόταρος, *Deiōtaros*). A tetrarch of Galatia in the first century B.C. He formed an alliance with the Romans against Mithridates, and so was made King by Pompey, 63 or 62 B.C. Armenia Minor was added to his domain. With several hundred horsemen he fought for Pompey at Pharsalus, in 48 B.C., and afterward fled with the latter. In 47 Julius Cæsar, then moving against Pharnaces (q.v.), pardoned Deiotarus, who had come to him as a suppliant. Several years later he was accused by his grandson Cæstor of aiding Cæcilius Bassus and of conspiring against Cæsar. He was defended by Cicero in the oration entitled *Pro Rege Deiotaro*, still extant. The result of the trial is not known. Deiotarus aided Brutus at the battle of Philippi and afterward sided with Octavius against Antony.

**DEIPH'OBÈ**. According to Vergil (*Æneid*, vi, especially 35-36), daughter of Glæucus and priestess of Apollo and Artemis, and the Sibyl at Cumæ who conducted Æneas to his father, Anchises, in the underworld.

**DEIPH'OBUS** (Gk. Δηϊφῶβος, *Dēiphobos*). In Greek legend, the son of Priam and Hecuba and one of the bravest of the Trojan heroes. After the death of Paris he married Helen, and she, after the fall of Troy, gave him up to Menelaus, her former husband, by whom he was killed and mutilated.

**DEIRA**. An ancient kingdom of Britain, corresponding closely to the modern Yorkshire. It formed a part of Roman Britain, and the town of York was the capital and seat of the Roman prefect. Ælla, a chief of the Angles, took possession of Deira about the middle of the sixth century. There was constant strife between Deira and its northern neighbor, Bernicia, which delayed the full conquest of northern Britain. Æthelfrith of Bernicia drove out Ælla's son in 588 and united the two kingdoms under the name Northumbria. In 603 the forces of the North Britons were annihilated at the Degestan, and the rule of Northumbria was established from the Humber to the Forth. In 627 Christianity was accepted. Bernicia and Deira became separate kingdoms about 633, but were reunited in 651. Later Deira was a sepa-

rate kingdom under the Danes. It was a number of native prisoners of Deira, exposed for sale in the slave market at Rome, that attracted the attention of Gregory I and led to the Christianizing of Britain, according to the old legend.

**DEIR-EL-BAHRI**, dār el-bā'rē (northern convent). The modern Arabic name of a famous Egyptian temple near the site of the ancient Thebes (q.v.). It was built by Queen Hatshepsut (Hatsa), the sister and wife of Thothmes II, but was never completed. In Christian times it became a monastery, whence its modern name, and the reliefs adorning the walls were badly mutilated by zealous monks, who regarded them as remnants of heathenism. The temple was dedicated to the god Ammon of Thebes, and also contained chapels for the deities Athor and Anubis, as well as a funerary chapel for Queen Hatshepsut. It is built upon three terraces rising in successive steps from the plain, each containing a court with columned porticoes and other buildings. The principal buildings surround the upper court, at the rear of which is the sanctuary. The walls of the various halls and chapels are magnificently decorated with sculptures and paintings. In one of the halls is depicted the fleet sent by Queen Hatshepsut to Punt on the Somali coast. (See EGYPT, *History*.)

The site was examined by Mariette, and later Naville, acting under the auspices of the Egyptian Exploration Fund, cleared the whole temple of rubbish and explored it systematically. In 1881 no fewer than 39 mummies and coffins of kings and members of the royal house were found in a deep, rocky pit near Deir-el-Bahri and removed to the Bulak Museum. Among the mummies found were those of Seqenen-Rē, Amasis I, Amenophis I, Thothmes II, Thothmes III, Seti I, Ramesses I, and Ramesses II. In 1906, the year which marked the completion of the excavations of the eleventh dynasty temple on this site, a fine statue of a Hathor cow was found *in situ* in its shrine (consult *Egyptian Exploration Fund Memoirs*, 1907, frontispiece) and the fine temple of Mentuhetep was cleared out. In 1913 the expedition of the Metropolitan Museum of Art discovered the causeway to the latter temple. Consult: Mariette, *Deir-el-Bahri* (Leipzig, 1877); Dümichen, *Flotte einer ägyptischen Königin* (ib., 1868); *Egypt Exploration Fund Memoirs*, vols. xii-xiv, xvi, xix, xxvii, xxix, xxx, xxxii (London, 1894-1913); *Guide to the Temple of Deir-el-Bahri*, published by the Egyptian Exploration Fund (ib.).

**DEIR-EL-KAMAR**, el-kā'mēr, or DER-EL-KAMAR (Ar. monastery of the moon). A town of Syria and once the seat of Emir Beshir, the chief sheik of the Druses. It is built in terraces on the side of a steep hill in the glen of Mount Lebanon, at an altitude of over 2800 feet, about 13 miles from Beirut. The slope is devoted to cultivation of the vine and the raising of grain. The chief industry is the production of silk stuffs and embroideries. Pop., about 8000, chiefly Maronites. Deir-el-Kamar has been the centre of many conflicts between the Maronites and the Druses.

**DEISM** (Fr. *déisme*, from Lat. *deus*, god), or **THEISM** (Fr. *théisme*, from Gk. *theos*, *theos*, god). A term which properly means belief in a god, or opposed to atheism. In common language, however, deism is the belief in the existence and providence of God, grounded on the evidence afforded by reason and nature, rather than on testimony of a supernatural revelation.

The term "deists," or "freethinkers," is especially used to designate a school or series of writers who appeared in England in the seventeenth and eighteenth centuries, and who aimed to establish natural religion upon the basis of reason and free inquiry and to bring all positive or revealed religion to the test of this. The leading names in this school are: Lord Herbert of Cherbury (died 1648); John Toland, whose *Christianity Not Mysterious* (London, 1696) gave exact expression to the tendency of the deists; the third Earl of Shaftesbury; Anthony Collins (died 1729), the friend of Locke; Thomas Woolston; Matthew Tindal, the author of *Christianity as Old as the Creation, or the Gospel a Republication of the Religion of Nature* (ib., 1730); Viscount Bolingbroke. Consult: A. S. Farrar, *History of Free Thought* (ib., 1863); Leslie Stephen, *History of English Thought in the Eighteenth Century* (ib., 1881); Robertson, *Short History of Free Thought* (ib., 1906); Flint, *Anti-Theistic Theories* (Edinburgh, 1879).

**DEISSMANN**, di'smān, GUSTAV ADOLF (1866- ). A German New Testament scholar, born in Langenscheid, Nassau, and educated at the University of Berlin and the Herborn Theological Seminary. He entered the ministry in 1890, became a teacher at Marburg in 1892 and at Herborn in 1895, and was made professor at Heidelberg in 1897 and at Berlin in 1908. He lectured in Cambridge (England) in 1907 and at Upsala in 1910, and received the honorary degree of D.D. from Aberdeen (1906), St. Andrews (1911), and Manchester (1912). Among his valuable publications are *Die neutestamentliche Formel "in Christo Jesu"* (1892), *Bibelstudien* (1895, 2d series, 1897; Eng. trans., 1901-03); *Theologie und Kirche* (1900); *The Epistle of Pseudo-Sirius* (1902), *Die Hellenisierung des semitischen Monotheismus* (1903); *Evangelium und Urchristentum* (1905); *New Light on the New Testament* (1907); *Philology of the Greek Bible* (Cambridge Lectures, 1908); *Light from the Ancient East* (1910); *Urgeschichte des Christentums in Lichte der Sprachforschung* (1910); *St. Paul* (1912, in English, also in German and Swedish).

**DEITERS**, di'tērs, HERMANN (1833-1907). A German philologist and writer on music. He was born in Bonn. At first he studied law and for a short time followed it as a profession in Berlin, but returned to Bonn to study philology. He received the degree of Ph.D. in 1858. As a writer on music, he soon attracted attention, especially with his excellent essays on Brahms. In 1880 he published the first authoritative biography of the master, which was completed, after Brahms's death, in 1898. His most important work is the translation into German of A. W. Thayer's monumental biography of Beethoven (never published in the English original). Only the first three volumes were completed by Thayer; the fourth and fifth volumes were written by Deiters on the basis of the materials collected by Thayer.

**DÉJAZET**, dā'zhā'zā', PAULINE VIRGINIE (1797-1875). A celebrated French actress. She was born in Paris, Aug. 30, 1797 (some accounts say 1798). From the time she was five years old, when she began playing children's parts with marvelous precocity of intelligence and grace, till she was over 70, her career upon the stage was an almost uninterrupted success. After experience in several Parisian theatres

she went to Lyons and Bordeaux, where she won great popularity in soubrette rôles. Returning to Paris (1820), she played successively at the Gymnase, the Nouveautés, the Gaîté, and the Palais Royal, where she made some of her greatest hits in young men's parts. These, called rôles *travestis*, were so distinctive that they, together with her quick-witted soubrette rôles, came to be known as a class by themselves, *Déjazets*. Famous especially were her impersonations in *Les écoliers en vacances*, *La petite sœur*, *Le plus beau jour de la vie*, *Le fils de l'homme*, *Sophie Arnould*, *Frétillo*, and numerous others. After 1845 she played for a time at the Variétés and made successful tours abroad. In 1859, with her son Eugène, she undertook the management of the Folies-Nouvelles, then known as the Théâtre Déjazet. Here she brought out several of Sardou's earlier pieces, among them *Monsieur Garat* and *Les prés Saint-Gervais*. She retired from the stage in 1868, but appeared again even within a year of her death, which occurred Dec. 1, 1875. Countless stories are told of her brilliant wit and personal charm. Consult Duval, *Virginie Déjazet, 1797-1875* (Paris, 1876); Lecomte, *Virginie Déjazet: étude biographique* (ib., 1866); Mirecourt, "Déjazet," in *Les contemporains* (ib., 1854).

**DEJEAN**, de-zhân', JEAN FRANÇOIS AIMÉ, COMTE (1749-1824). A French general and statesman, born at Castelnaudary. He fought with distinction in the wars of the Revolution, rising successively to the rank of brigadier general and general of division. He was Minister of War from 1802 to 1809 and, after the first Restoration, was appointed governor of the Polytechnic School. Upon the return of Napoleon from Elba he rendered valuable services until after the battle of Waterloo. He was also at that time grand chancellor of the Legion of Honor and aid-de-camp of Napoleon.

**DEJEAN**, PIERRE FRANÇOIS AIMÉ AUGUSTE, COMTE (1780-1845). A French general and entomologist, son of the preceding. He was born at Amiens and took up the study of medicine, but soon entered Napoleon's army, with which he went to Spain and to Russia. In the army he attained the rank of a general of division and at Waterloo acted as adjutant to the Emperor. From 1815 to 1819 he was kept in exile by the Bourbons. Devoting all his leisure to science, Dejean made extensive collections of insects and contributed much to our knowledge of Coleoptera (beetles). He is the author of the following works: *Iconographie des coléoptères d'Europe* (1829-36); *Espèces générales des coléoptères* (1825-37); *Histoire naturelle et iconographie des coléoptères d'Europe*. The last-named work is still a standard on the subject of Coleoptera. The works were written by Dejean in conjunction with Boisduval and Aubé.

**DEJERINE**, dè-zhe-rên', JULES (1849- ). A French alienist, educated at Paris. In 1879 he became head of the medical clinic at the Charité Hospital, in 1893 took charge of the course in clinical medicine at the Necker Hospital, in 1895 became physician at the Salpêtrière, and in 1910 was appointed professor of the clinic of nervous diseases. He wrote on aphasia, especially attacking Pierre Marie's theory of the origin of this disease, and on many other topics connected with nervous diseases, and published: *L'Hérédité dans les mala-*

*dies du système nerveux* (1886); *Anatomie des centres nerveux* (1894), in collaboration with his wife, née Klumpke, herself a well-known neurologist; *Sémiologie du système nerveux* (1900); *Traité des maladies de la moelle épinière* (1902, with Thomas).

**DE KALB**. A city in De Kalb Co., Ill., 58 miles west of Chicago, on the Chicago and Northwestern, the Chicago, Aurora, and De Kalb, the Chicago Great Western, and the Chicago, Milwaukee, and Gary railroads (Map: Illinois, D 2). It is the seat of the Northern Illinois State Normal School and contains barbed-wire factories, wire-drawing and woven-wire mills, agricultural-implement works, piano, shoe, glove, mitten, nail, and creamery-package factories, etc. The government is administered by a mayor, biennially elected, and a municipal council. The city owns and operates its water works. Settled about 1838, De Kalb was incorporated in 1877. Pop., 1890, 2579; 1900, 5904; 1910, 8102; 1914 (est.), 9036. De Kalb was the scene of an engagement in the Black Hawk War. Here, after the battle, Lincoln, Davis, and Zachary Taylor held a conference.

**DE KALB**, BARON. See KALB, JOHANN, BARON DE.

**DE KAY**, CHARLES (1848- ). An American author and critic. He was born in Washington and graduated at Yale University in 1868. He was associated with the New York *Times* as literary and art editor from 1876 to 1906 and with the New York *Evening Post* in 1907. In 1894 he was appointed Consul General of the United States at Berlin, where he remained until 1897. During his sojourn abroad he established the Berliner Fechtclub, after previously founding a similar society (the Fencers' Club) in New York (1882). Among the literary and art societies which he took part in founding are the Authors' Club (1882), the National Sculpture Society (New York, 1892), the National Arts Club (New York, 1899), and the Circle of Friends of the Medallion (1907). Of the National Arts Club he became the managing director. Among his numerous publications are the following: *Hesperus and Other Poems* (1880); *Vision of Nimrod*, a dramatic poem (1881); *Love Poems of Louis Barnevel* (pen name, 1883); *Life and Works of Barye, Sculptor* (1889); *Bird Gods* (1898); and translations of Heinrich Heine's *Letters* and of several works from the French.

**DEKEN**, dâ'ken, AGATHE (1741-1804). A Dutch poet and novelist, born at Amstelveen. Many of her works were written in collaboration with her friend Elizabeth Bekker. These joint productions include the novels: *Historie van Sara Burgerhart* (1782); *Historie van Willem Levend* (1785); *Brieven van Abraham Blankaart* (1787); *Historie van Cornelia Wildschut* (1793). Her religious songs show her to have been possessed of a truly pious nature, while her descriptive poems are fine characterizations of the folk life of Holland. Especially noteworthy are the collections entitled *Liederen voor den boerenstand* (1804) and *Liederen voor Kinderen*.

**DEKKER**, EDUARD DOUWES (1820-87). A Dutch writer, the author of *Maar Havelaar* (1860), the Dutch *Uncle Tom's Cabin*. He was born in Amsterdam, March 2, 1820. He went in 1838 to the Dutch Indian colonies and remained 18 years in government employ, endeavoring to

mitigate the evils of native government, and resigning in 1856 because his zeal clashed with government interest in Java. Then he made his appeal to the public conscience in *Maw Havelaar*, revealing conditions of outrageous and inhuman extortion and making a great hit as a novel, but getting little sympathy and no redress for the victims. In 1866 he withdrew to Germany, where he published (in Dutch) a popular drama, *Vorstenschool* ('The School for Princes'); a novel, *La Sainte Vierge*; and several studies in political and social economy. He is well known by his pseudonym, Multatuli (Lat. *multa tuli*). The posthumous *Geschiedenis van Wouterje Pieterse* (1888), incomplete, was followed in 1892 by *Letters and Works*, ed. by his widow. Consult the biographies of Busken (in Ten Brink's *Hedendaagsche Letterkundigen*, 1885); Meerkesk (1900); also T. S. Abrahamsz, *Eduard Douwes Dekker: Eene ziektegeschiedenis* (1888).

**DEKKER, THOMAS** (c.1570-c.1641). An English dramatist and pamphleteer. Little is known of him. He was born in London. His dramatic career began as early as 1597, and before his death he wrote, single-handed or in collaboration, more than 40 plays, most of them for Henslowe. In 1600 were printed two of his best comedies, *The Shoemaker's Holiday* and *Old Fortunatus*. The former is a sprightly play and acts well. The latter contains scenes and passages of very great beauty. Dekker had been writing the previous year in conjunction with Ben Jonson, but the two dramatists had now fallen out. In 1601 Jonson ridiculed Dekker in *The Poetaster*. Dekker replied with *Satiromastix, or the Unrushing of the Humorous Poet* (1602). Of the plays that Dekker wrote after that, the most powerful is *The Honest Whore* (two parts, 1st part printed 1604; 2d part, 1630), in the composition of which he was aided by Middleton. Other plays in which Dekker bore a hand are: *Black Bate-man of the North* (1598); *The Roaring Girl* (1611); *The Virgin Martyr* (1622); *The Witch of Edmonton* (first published 1658). He wrought with a realistic aim, describing the middle and lower strata of London life. He also wrote several noteworthy pamphlets, of which *The Gull's Hornbook* (1609) is the best extant account of the London gallants. Other pamphlets deal with thieves and vagabonds; another, *The Wonderful Year* (1603), describes London suffering from the plague. Consult: *Dramatic Works*, ed. by Shepherd (4 vols., London, 1873); *Plays* (selected), ed. by Rhys (ib., 1887); *Nondramatic Works*, ed. by Grosart (5 vols., ib., 1884-86); the "Life" by Bullen, in the *Dictionary of National Biography*; Penniman, *The War of the Theatres* (Boston, 1897); Pierce, *The Collaboration of Webster and Dekker* (New York, 1909); Hunt, *Thomas Dekker* (ib., 1911).

**DE KO'VEN, (HENRY LOUIS) REGINALD** (1861- ). An American composer of songs and light operas, born in Middletown, Conn. When 11 years old, he was taken to Europe, where he received his education. He graduated from St. John's College, Oxford, in 1879. After he had been instructed in the usual musical grounding branches by Speidel, Lebert, and Pruckner, in Stuttgart, and by Hauff in Frankfurt, he took a course in vocalization with Vannucini in Florence and courses in light-opera composition with Genée, Von Suppé, and De-

libes. On his return from Europe in 1882 he took up his residence in Chicago, but subsequently moved to New York. From 1902 to 1904 he lived in Washington as conductor of the Washington Symphony Orchestra. He then returned to New York as musical critic of the *World*. His scores are melodious and show refinement of instrumental coloring and harmony. His greatest success has been *Robin Hood* (1890), a thoroughly delightful work of its kind. Others among his light operas are: *The Begum* (1887); *The Fencing Master* (1892); *Rob Roy* (1894); *The Highwayman* (1897); *The Three Dragoons* (1899); *Foxy Quiller* (1900); *Maid Marian* (1901); *The Student King* (1906). He also composed many songs, several of which have become well known.

**DELABARRE, dell'a-bär', EDMUND BURKE** (1863- ). An American psychologist, born at Dover, Me. He was educated at Brown University, Amherst College, Harvard, and Freiburg, and, beginning in 1891, was associate professor and then (after 1896) professor of psychology at Brown. In 1896-97 he was also director of the Harvard Psychological Laboratory during the absence of Professor Munsterberg. He was elected a fellow of the American Association for the Advancement of Science. He is author of *Ueber Bewegungsempfindungen* (1891) and *Report of Brown-Harvard Expedition to Nachvak, Labrador, in 1900* (1902).

**DELABARRE-DUPARCQ', de-la'bär' dy'-pärk', NICOLAS EDOUARD** (1819-93). A French military critic and historian, born at Saint-Cloud, Seine-et-Oise. He studied at the Ecole Polytechnique and in 1849 was appointed professor of military history at the College of Saint-Cyr. Having entered the engineers in 1841, he rose in 1871 to the rank of colonel and was retired in 1879. He wrote, in addition to memoirs for the Academy of Moral and Political Sciences, *Biographie et marines de Maurice de Saxe* (1851); *Portraits militaires, Esquisses historiques et stratégiques* (2 vols., 1853-55); *Les chefs de guerre* (1867); *Histoire de Henri IV, roi de France et de Navarre* (1884).

**DE LA BÈCHE, de la bâsh, SIR HENRY THOMAS** (1796-1855). A distinguished British geologist. He was born near London and educated at the military school at Great Marlowe. He entered the army in 1814, but soon retired from public service to take up the study of science. For several years he traveled through England, France, and Switzerland, examining the geological formations and gaining a knowledge of mineralogy and petrography. His researches were the bases of frequent contributions to the *Transactions of the Geological Society*, in which he displayed great scientific ability. He was the first to conceive the plan of making a detailed geological map of England, a task he commenced upon his own responsibility; in 1832 the expense of this work was assumed by the government, and De la Bèche was appointed director. He labored for many years to establish the survey on a successful basis, and he was also concerned in founding a geological museum and a school of mines in London. The list of his publications includes many books recognized as standard works of reference and numerous papers contributed to scientific journals; among the more important are the following: *Manual of Geology* (1831); *Researches in Theoretical Geology* (1834); *Report on the*

*Geology of Cornwall, Devon, and West Somerset* (1839); *On the Formation of the Rocks of South Wales* (1846); *Geological Observer* (1853). De la Bèche was elected president of the Geological Society of London in 1847, and in 1855 he received the Wollaston medal from the same society. His distinguished services were also awarded by the bestowal of knighthood and by numerous marks of honor from foreign societies.

**DELABORDE**, de-la'bôrd', HENRI, COUNT (1811-99). A French art critic and historical painter, born in Rennes, son of Count Henri François Delaborde. He studied for some time in Paris with Delaroche and afterward produced historical pictures of a rather conventional classical type. Among them are: "Hagar in the Desert" (1836, Dijon Museum); "St. Augustine" (1837); "The Knights of St. John of Jerusalem" (1845), at Versailles. He also painted frescoes in the church of St. Clotilde, Paris. But he is known principally as a critic of art. Besides his writings, as perpetual secretary of the Académie des Beaux-Arts, he contributed to the *Revue des Deux Mondes* and other periodicals. These articles have been collected as *Mélanges sur l'art contemporain* (1866) and *Études sur les beaux-arts en France et en Italie* (1864). He published, among other volumes, *Ingres, sa vie, ses travaux, sa doctrine* (1870); *Lettres et pensées d'Hippolyte Flandrin* (1865); *Gérard Edelinck* (1886); *La gravure* (1882); *La gravure en Italie* (1883); *Marc Antoine Raimondi* (1887); *Les maîtres florentins du XV siècle* (1889); *L'Académie des Beaux-Arts depuis la fondation de l'Institut de France* (1891). He was elected to the Institute in 1868 and was conservator of the department of prints in the National Library, Paris, from 1855 to 1885.

**DELABORDE**, HENRI FRANÇOIS, COUNT (1764-1830). A French soldier, born in Paris. He successively became a brigadier general, chief of staff, and commander in Corsica. As a general of division, he conducted the campaigns in the Pyrenees (1794) and on the Rhine. In 1812 he was a general of division in Mortier's "Jeune Garde," which fought so gallantly in the Russian campaign. Upon the return of Napoleon from Elba he again espoused the cause of the Emperor. With the advent of the Restoration he was brought before a military tribunal (September, 1816), but was acquitted.

**DELAEROIX**, de-la'kroix', (FERDINAND VICTOR) EUGÈNE (1798-1863). One of the most important French painters of the nineteenth century, the chief leader of the Romantic school; also a lithographer and etcher. He was born at Charenton-Saint-Maurice, near Paris, April 26, 1798. Under the Directory his father had been Minister of Foreign Affairs and had held other offices of honor. He mismanaged the family property, and the son had to struggle hard for an existence. At 18 he entered the studio of Guérin, and there became the friend of Géricault, who greatly influenced him; but his chief teachers were the old masters of the Louvre, whom he diligently copied. Joining Géricault in the new Romantic movement, he became, after the latter's death, its recognized leader. He first exhibited in 1822 the "Bark of Dante," which, although fiercely attacked by the critics, made a great impression, was purchased for the Luxembourg Gallery, and is now in the Louvre. His "Massacre of Chios," exhibited in 1824 and now in the Louvre, caused

an even greater sensation. Indeed, it may be termed a manifesto of the new Romantic school. The types were individual and characteristic instead of general and typical, as in the Classic school. The old ideas of composition were altogether disregarded, and the scene portrayed was one of gloomy horror and pathos. The painter was accused of worshipping the hideous instead of the beautiful, and his picture was dubbed "The Massacre of Painting." Its sale, however, enabled him to visit England in 1825 and further to increase his knowledge of the English colorists, by whom he had already been influenced. During this visit he acquired his lifelong fondness for English literature, especially for Byron, Scott, and Shakespeare, whom along with Goethe he preferred to the classic authors of his own country. In 1832 he was sent as a member of an embassy to Morocco, and he also visited Spain and Algiers. These travels enriched his palette with bright colors, and his Oriental subjects brought him great popularity. Nevertheless he was unfortunate in selling his pictures and would have been in uncomfortable circumstances had he not received frequent commissions from the government after the revolution of 1830. He was selected to execute mural paintings in a number of public buildings and distinguished himself as much in this task as he had previously done in his canvases. A member of the Academy in 1857, he exhibited his last picture in 1859 and died in Paris on Aug. 13, 1863. His life was solitary and nearly all spent in his studio. He suffered much from ill health, which only urged him to greater exertions. He was of a refined and sensitive disposition and was deeply wounded by the bitter controversies which his pictures provoked.

Delacroix was one of the greatest painters of the nineteenth century and one of the greatest colorists of all times. His work has often been compared with that of Rubens, who exercised great influence upon him. His coloring is bright, but simple, the primary colors being chiefly used, and he is fond of obtaining color effects by placing complementary colors together. He has been criticized as being deficient in drawing, perhaps justly, although his surviving drawings reveal an excellent draftsman, and, when he sacrificed the distinctness of outline to color, he did it knowingly, as the greatest colorists have done before him. His art is impetuous and intensely dramatic, and he delights in passion and in motion. His activity extended over an immense variety of subjects; he painted everything—saints, warriors, lovers, animals, flowers, the ocean—and all equally well. He ransacked history and literature for subjects, but always rendered them as a painter in his own great language of color.

In his long career he produced some 853 oil paintings and 1525 water colors and pastels. Among his chief historical works, besides those mentioned above, are: "Hellas Mourning over the Ruins of Missolonghi"; "Milton and his Daughters"; the "Death of the Bishop of Liège," after Scott's *Quentin Durward* (Louvre); the "Entry of the Crusaders into Constantinople"; "The Barricade," a scene from the July Revolution (Louvre), which secured him the cross of the Legion of Honor; "The Abduction of Rebecca" (Metropolitan Museum). Among his Oriental subjects are: "Algerian Women" (Louvre); the "Convulsionaries of Tangier"; the "Jewish Wedding in Morocco." He also

portion is protected by the Inyack peninsula and island and forms there a safe and ample anchorage. Delagoa Bay receives the waters of several rivers—the Maputu, the Umbelosi, the Crocodile, the Umfusi. The coasts are low and covered with mangrove forests. The commercial importance of Delagoa Bay is very considerable, owing to the fact that it contains the port of Lourenço Marques, which is connected by rail with Pretoria (since 1895), thus affording an outlet for the output of the gold fields of the Transvaal. The imports of Lourenço Marques amount to approximately 5 million dollars annually, chiefly foodstuffs, manufactures, and machinery, of which a large part pass thence to Pretoria. The railway from Lourenço Marques to Pretoria was constructed by a company of American and English capitalists and seized by the Portuguese government after the death of the concessioner. After 10 years of litigation the case was decided, in 1900, in favor of the United States and Great Britain, although the Portuguese government was made to pay an indemnity of only about \$3,000,000. Several short railway lines penetrate the adjacent territory. The Delagoa Bay Railway has a length of 57 miles in the colony and is continued 290 miles to Pretoria. The Beira Railway with about 200 miles of line in the colony is continued from the British frontier to Bulawayo. During the South African War the port of Lourenço Marques was used for smuggling supplies to the scene of action. The British government, in order to prevent further violation of neutrality, blockaded the port and seized several vessels, proceedings which led to some international complications. Consult Tasset, *The Key to South Africa, Delagoa Bay* (London, 1899).

**DELAGRANGE**, de-la-grā'zhi', Léon (1872-1910). A French aviator; also a sculptor. He was born at Orléans and studied at the École des Beaux-Arts, Paris. As a sculptor, he is known for several notable works, especially "Florentine Page," "A Templar," "Love and Youth," "A Huguenot," and "Girl Dancers." In September, 1908, a year after his first flight in an aeroplane, he established a record of 15.2 miles in 29 minutes, 53 seconds, and in 1909 he received the Lagatiner prize at Juvisy (36 miles in 10 minutes, 18 seconds), made a sensational flight in a storm at Doncaster, England, on October 17 established a world record (6 miles in 7 minutes, 36 seconds), and in December made a new monoplane record. In 1910 he was killed in an accident with his monoplane at Pau. He was president of the Aéro Club of France in 1907, in 1909 was decorated with the order of the Legion of Honor, and in 1910 received a medal from the Paris Academy of Sciences.

**DE LA HIRE**, de là-ēr, PHILIPPE (1640-1718). A French writer of considerable prominence on the theory of curves. He was born in Paris and was professor of mathematics in the Collège Royal and at the Académie d'Architecture. The following are his most important works: *Nouvelle méthode de géométrie* (1673); *Sectiones Conicæ* (1685); a treatise on epicycloids and roulettes (1694-1706). He was a pupil of Desargues and founded his researches in conic sections and roulettes on the works of his master.

**DELABRE**, de-lān'br', JEAN BAPTISTE JOSEPH (1749-1822). A French astronomer, born at Amiens. He studied first under Delisle

and afterward under Lalande, with both of whom he formed a close friendship. When, in 1781, the planet Uranus was discovered by William Herschel, Delambre worked out tables of its motion that obtained for him the annual prize of the Academy and attracted to him the attention of the learned world in general. Soon after he commenced the construction of new solar tables, and at a still later period tables of the motions of Jupiter and Saturn. Along with Méchain, he was appointed by the French government, in 1792, to measure the arc of the meridian between Dunkirk and Barcelona, which was completed in 1799. Afterward he was elected a member of the Academy. In 1802 he was appointed inspector general of education and in 1803 perpetual secretary of the mathematical section of the Institute. The result of his measurements appeared in his great work, *Base du système métrique décimal* (3 vols., 1806-10), for which he was awarded the decennial prize of the Institute in 1810. In 1807 he obtained the chair of astronomy at the Collège de France, rendered vacant by the death of Lalande, his master and friend. In 1814 he was appointed a member of the Council of Public Instruction. Delambre received a multitude of honors during his lifetime. He was a member of most of the learned bodies in Europe and an officer of the Legion of Honor. His writings are very numerous. The principal are: *Astronomie théorique* (3 vols., 1814); *Histoire de l'astronomie ancienne* (2 vols., 1817); *Histoire de l'astronomie au moyen âge* (1819); *Histoire de l'astronomie moderne* (2 vols., 1821); *Histoire de l'astronomie au dix-huitième siècle* (1823-27), published under the care of Matthieu. Besides these, Delambre is the author of several excellent *Mémoires*.

**DE LA MOTTE-GUYON**. See GUYON.

**DE LANCEY**, EDWARD FLOYD (1821-1905). An American lawyer and author, born at Mamaroneck, N. Y., and educated at Hobart University and at the Harvard Law School. He was associated with various historical societies and was president of the New York Genealogical and Biographical Society from 1873 to 1877. Among his contributions to the history of New York State are the following: *Documentary History of New York* (1851); *The Capture of Fort Washington the Result of Treason* (1877); *History of Mamaroneck, New York* (1886); *The Origin and History of Manors in the Province of New York* (1886).

**DE LANCEY**, JAMES (1703-60). An American jurist. He was born in New York, the son of a French Huguenot, was educated at Cambridge, England, and was admitted to the English bar. He returned to New York in 1729 and became a leader in the affairs of the city and province. In 1731 he was appointed a judge of the Supreme Court of the province and from 1733 until his death he was Chief Justice. In 1747-55 and 1757-60 he was Lieutenant Governor. He was one of the founders of King's College, now Columbia University, and presided over the Albany Convention of 1754 (q.v.).

**DE LANCEY**, OLIVER (1708-85). A British soldier, born in New York City. He was the youngest son of Etienne, and the brother of James De Lancey, the Lieutenant Governor of New York. He fought in the French War, was colonel in chief under General Abercrombie, and was present at the attack on Fort Ticcon-

deroga. From 1760 to 1766 he was a member of the Provincial Council of New York. During the Revolution he occupied responsible positions on the Loyalist side and was commissioned brigadier general to raise 1500 troops for the defense of Long Island. He commanded one of three battalions raised, which occupied Long Island. His estates being confiscated, he went to England. His losses were estimated at \$390,000, and he received \$125,000 in compensation.

**DE LANCEY, OLIVER** (1749-1822). An American soldier. The son of Oliver De Lancey (1708-85), he was born in Edinburgh, Scotland. He entered the British army in 1766, served in the Seventeenth Light Dragoons (of which he eventually became colonel), and was sent to America to prepare accommodations for the regiment. He was present at Bunker Hill and with his regiment participated in the victory of the British at the battle of Long Island. After the capture of General Woodhull and his forces at Jamaica, L. I., it was De Lancey who rescued the wounded general from British sentries when Woodhull tried to escape. The charge that De Lancey struck Woodhull after he had surrendered was not sustained. He occupied important positions in the Loyalist army and was made adjutant general as successor to Major André (1780). At the close of the war De Lancey returned to England, was appointed to settle military claims of the Loyalists, and sat in Parliament from 1796 to 1802. In 1804 his barrack accounts were discovered to be in bad condition, but his apparent defalcations did not result in prosecution; and in 1812 he was promoted general.

**DE LANCEY, WILLIAM HEATHCOTE** (1797-1865). An American clergyman. He was born in Mamaroneck, N. Y., graduated at Yale in 1817, and studied theology under Bishop Hobart. After being assistant to Bishop White, of Philadelphia, and secretary to the House of Bishops in the General Convention of the Episcopal Church in the United States, in 1828 he became provost of the University of Pennsylvania, and in 1833 assistant minister, and in 1836 rector, in St. Peter's Church, Philadelphia. He was chosen Bishop of the diocese of Western New York in 1838, and in 1852 was a delegate from the Episcopal bishops of the United States to England.

**DE LAND.** A city and the county seat of Volusia Co., Fla., 60 miles south of St. Augustine, on the Atlantic Coast Line Railroad (Map: Florida, E 2). It is a health and winter resort known for its sulphur springs and its fine shell-paved and shaded streets, contains Carnegie and Sampson libraries, and is the seat of the John B. Stetson University (Baptist), opened in 1887. The city shipped 350,000 boxes of oranges in the year 1913-14. De Land owns its water works. Pop., 1900, 1449; 1910, 2812.

**DELAND, MARGARET WADE (CAMPRELL)** (1857- ). An American novelist, born at Allegheny, Pa. She was educated at New Rochelle, N. Y. She married L. F. Deland, of Boston, in 1880. She commended herself most strongly, perhaps, by those of her stories of which Dr. Lavendar, with his keen yet kindly insight, is the centre, and in which appear a varied group of village characters faithfully and graphically portrayed. In 1886 *The Old Garden and Other Verses* appeared. Her first novel, *John Ward, Preacher*, was published in

1888. She wrote also *Sidney*, a novel (1889); *Story of a Child* (1892); *Mr. Tommy Dove and Other Stories* (1893); *Philip and his Wife* (1895); *Old Chester Tales* (1899); *Dr. Lavendar's People* (1904); *The Common Way* (1904); *The Awakening of Helena Richie* (1906); *The Way to Peace* (1910); *The Iron Woman* (1911); *Partners* (1913).

**DELANE, dé-lan', JOHN THADDEUS** (1817-79). An English journalist, editor of the *London Times*. He was born in London, Oct. 11, 1817, was educated at Oxford, and called to the bar at the Middle Temple. At the age of 23 he became editor of the *Times*, of which his father was financial manager. Under his editorship the newspaper exerted an influence unparalleled in the history of journalism. He exposed the railway mania (1845), took an active part in the repeal of the corn laws, and led public opinion during the Crimean War. He retired in 1877, and died Nov. 22, 1879. Consult A. I. Dasent, *John Thaddeus Delane: Life and Correspondence* (2 vols., New York and London, 1908).

**DELANO, COLUMBUS** (1809-96). An American lawyer, born in Shoreham, Vt. He was taken as a child to Ohio where he was educated at the common schools, and was admitted to the bar in 1831, and became known as a criminal lawyer. He was commissary general of Ohio in 1861, served three terms in Congress (1845-47, 1865-69), and in 1869 was appointed Commissioner of Internal Revenue, in which capacity he increased the receipts more than 100 per cent in eight months. In October, 1870, he resigned and from then until 1875 was Secretary of the Interior. He endowed the preparatory school at Gambier, Ohio, which bears his name.

**DELANO, FREDERIC ADRIAN** (1863- ). An American railroad president, born in Hongkong, China. After graduating from Harvard University in 1885 he was employed by the Chicago, Burlington, and Quincy Railroad in various capacities, rising from the position of civil engineer to be general manager at Chicago. For a time he was consulting engineer to the United States War Department in respect to the railroads of the Philippine Islands. In 1905 he became president of the Wheeling and Lake Erie, of the Wabash-Pittsburgh Terminal, and of the Wabash railroads. He was appointed one of the receivers for the Wabash in 1911, and in 1913 he was elected president of the Monon Railroad. He was vice president of the American Unitarian Association in 1907. His addresses were published under the titles *Questions of the Hour* (1911) and *Are Our Railroads Fairly Treated?* (1913).

**DELANY, MARY (GRANVILLE)** (1700-88). An English author, born at Coulston, Wiltshire. She was a friend of the Duchess of Portland, Miss Burney, George III, and Dean Swift. In her own day she became noted for her "flower work"—an arrangement of bits of colored paper in a kind of mosaic, some of which are now in the British Museum. Her *Autobiography and Correspondence* (ed. by Lady Hanover, 1st series, 3 vols., 1861; 2d series, 3 vols., 1862) contains many anecdotes of Pope, Swift, and other literary folk of the time. Consult the *Diary of Madame D'Arblay* (Fanny Burney) (London, 1842-46), and E. M. Symonds, *Mrs. Delany, Mary Granville: A Memoir* (New York, 1900).

**DELANY, PATRICK BERNARD** (1845- ).

An American electrician and inventor, born in County Kings, Ireland. He early came to the United States and learned telegraphy at Hartford, Conn.; gradually he worked up from office boy to be superintendent of lines. Later he was also a newspaper correspondent, editor, and writer. His inventions include more than 150 patents, covering anti-induction cables, synchronous multiplex telegraphy by means of which six messages may be sent simultaneously over one wire, automatic ocean-cable systems, and rapid-machine telegraphy for land lines. His automatic telegraph system is capable of transmitting and recording 3000 words a minute over a single wire. He was awarded gold medals at the International Invention Exhibition in London (1885), at the Pan-American Exposition (1901), and at the St. Louis Exposition (1904), the Elliott-Cresson gold medal twice, and the John Scott medal of the Franklin Institute. From 1893 to 1895 he was a vice president of the American Institute of Electrical Engineers.

**DE LA PASTURE**, de lăp'pă-tăr, MRS. HENRY (LADY CLIFFORD). An English novelist and dramatist, daughter of Edward Bonham, British Consul at Calais. She married in 1887 Henry de la Pasture (who was a son of the Marquis de la Pasture and who died in 1908), and in 1910 Sir Hugh Clifford (q.v.). She writes of everyday life with grace and with sentiment and with a humor that has been compared to that of Jane Austen. Among her novels are: *The Little Squire* (1894, dramatized); *Deborah of Tod's* (1897); *Adam Grigson* (1899); *Catherine of Calais* (1901); *Cornelius* (1903); *Peter's Mother* (1905); *The Man from America* (1906); *The Toy Tragedy* (1906, a juvenile); *The Lonely Lady of Grosvenor Square* (1907); *Catherine's Child* (1908); *Grey Knight* (1908); *Unlucky Family* (1908); *The Tyrant* (1909); *Master Christopher* (1911); *The Honorable Mrs. Garry* (1912; in England, called *Erica*); *Michael Ferrys* (1913). Her more successful plays were: *Peter's Mother*, which had a long run in 1906 and was revived in 1909; *Deborah*, played in Boston in 1909-10; and *Erica* (1912).

**DE LAPLANCHE**, de-lă'plănxh', EUGÈNE (1836-91). A French sculptor, born at Belleville (Seine). He was a pupil of Duret, gained the *Prix de Rome* in 1864, and the medal of honor in 1878. His "Messenger of Love" (1874), "Aurora" (1878), and the "Virgin of the Lilies" (1884), are in the Luxembourg. Other works by him are "Music" (1878, Paris Opera House), called his masterpiece, "Eve After the Fall" (1870); "Maternal Instruction" (1875, Square of Sainte-Clothilde, Paris); and the statues of "Security" and "Commerce" (1884) in the Hôtel de Ville, Paris (replicas in the Chicago Art Institute). He is also noted for his decorations in relief on vases of Haviland faience. His best work is naturalistic, but at the same time dignified and simple in line, and shows sound mastery of technique. He is represented by 15 works in the Glyptothek, Copenhagen, and in many French museums and in churches.

**DE LA RAMÉE**, de la rá'má', LOUISE (pseud. OUIDA). See RAMÉE.

**DE LA REY**, de la rá'e, JACOBUS HENDRICK (1847-1914). A famous Boer military leader of French Huguenot descent. He was born in the Lichtenburg District of the Western Transvaal, whither his father had moved after Sir Harry

Smith and the British troops had driven them from the Orange Free State, in consequence of their participation with Pretorius in the driving out of the British from Bloemfontein in 1848. His early life was marked by a severe training in the art of warfare, through numerous campaigns against hostile Kafir tribes. His first experience as a commanding officer was against the Basutos in the early 60's, during which he distinguished himself so conspicuously that when the Boer-British War of 1899-1902 broke out, he was unanimously elected to the command of the Lichtenburg burghers, who afterward formed part of Cronje's western column. Like Cronje, he rarely carried weapons on the field, but was never seen without his field glass, pipe, and Bible. Previous to the war he had represented his district for some years in the Volksraad and was a consistent supporter of Joubert as against Kruger. He was not among the Boers who were anxious to begin war and was one of the few leading members of the Transvaal Volksraad who protested against the ultimatum of President Kruger. Hostilities once begun, however, he rapidly became one of the most determined leaders of his people and in the first stages of the war greatly distinguished himself by the skill with which he laid out the lines of the battle of Magersfontein and other smaller encounters. Later, he conducted a well-ordered retreat before the British advance under Lord Roberts and at Nooitgedacht, in 1900, captured 500 British troops. In the second or guerrilla stage of the war he was equally distinguished by his successful tactics, his most important success being the capture of the British general, Lord Methuen, on March 7, 1902, together with a number of British troops. His lack of hospital accommodations and the necessity he was under of making forced and sudden marches precluded his detention of the wounded Lord Methuen, whom he accordingly had to release. His entire career throughout the war was marked by great personal gallantry and by the humane treatment accorded to his enemies. With the Boers he was one of the most popular leaders of the two republics, and he gained from his foes the reputation of being a leader of unerring military judgment and remarkable resourcefulness. In 1902 he took part in the peace negotiations with Great Britain and was one of the deputation appointed to visit Europe and the United States for the purpose of raising funds for the distressed Boers. In December, 1903, he went to India in order to induce the Boer prisoners of war at Ahmednagar to take the oath of allegiance to England. After the formation, in 1907, of the new Transvaal Parliament he became a member of the Legislative Assembly.

**DE LA RIVE**, de lá rév', AUGUSTE ARTHUR (1801-73). A Swiss physicist who devoted much attention to researches in electricity. He was born in Geneva and at the age of 22 was appointed to the chair of natural philosophy in the Geneva Academy. He was one of the first to investigate the temperature of the earth's crust and made observations in an artesian well 700 feet in depth. He discovered the process of electrogilding, and in 1842 received for it a prize of 3000 francs from the French Academy of Sciences, of which in 1864 he was made a foreign associate. He made original discoveries in connection with magnetism, electrodynamics,

the connection of magnetism with electricity, the properties of the voltaic arc, and the passage of electricity through extremely rarefied media. He published a complete treatise on electricity (1853-58), which was for many years considered a standard work.

**DELA ROCHE**, de-lá'rósh', PAUL (1797-1856). A French historical and portrait painter. He was born in Paris, July 17, 1797, and was a pupil of Watelet and of Baron Gros. He soon became one of the most representative painters of his time, for he was an eclectic, who endeavored to unite the excellences of the Classic and Romantic schools, the line of the one with the color of the other. In his "Joan of Arc" (Wallace collection, London) and the "Death of Queen Elizabeth" (Louvre) he essayed to follow the Romantic school, but early turned to historical painting. His "Death of the Duke of Guise" (1835, Chantilly Museum) and "Cromwell Opening the Coffin of Charles I" (1831, Nîmes Museum) are executed with technical power and fine dramatic effect. His "Children of Edward IV in the Tower" (Louvre) appeared in 1831. Among other historical subjects are the "Execution of Lady Jane Grey" (1834) and "Lord Strafford on the Way to Execution" (1837). His most ambitious work, finished in 1841, is the hemicycle in the Theatre of the Ecole des Beaux-Arts in Paris. In it the arts of different nations are depicted, and the 70 life-size figures that occupy the canvas are portraits of the artists of the times and countries represented. The figure that represents Gothic architecture is said to be a portrait of the painter's wife, who was a daughter of Horace Vernet. After her death, in 1845, he produced "Christian Martyr" (1855, Louvre), the "Crown of Thorns," and the "Return from Golgotha." These pictures show a spontaneity and freedom of treatment not always apparent in the works of Delaroche and express a new impulse born of love and sorrow. Among his later historical works are: "Napoleon at Fontainebleau," painted in 1845 (Leipzig Museum); "Bonaparte at St. Bernard" (1850); "Marie Antoinette Before the Revolutionary Tribunal" (1851). From 1840 until his death he was the most popular portrait painter in France. In the historical accuracy of his compositions Delaroche surpassed all other painters of his day. But he painted without impetuosity and consequently with little feeling. Although he had the pictorial sense in a high degree, he often bordered on the melodramatic. His large and sumptuous picture of the "Death of Queen Elizabeth" is an instance of this. He painted rich stuffs with great skill, but never touched high sentiment or deep feeling. S. W. Reynolds, Desclaux, and others have engraved his principal works. Delaroche was a member of the Institute and a professor in the Ecole des Beaux-Arts; he was an officer of the Legion of Honor and received many medals. He died in Paris, Nov. 4, 1856. Consult the monographs by Loménie (Paris, 1844); Mirécourt (ib., 1856); Halévy, *Notice sur la vie et les ouvrages de Paul Delaroche* (ib., 1858); Rees, *Horace Vernet and Paul Delaroche* (London, 1880); Lalaing, *Les Vernet, Gericault, et Delaroche* (Paris, 1888); Muther, *History of Modern Painting* (London, 1907).

**DE LA ROCQUE**, SIEUR. See ROBERVAL.

**DE LA RUE**, del'á-roo', WARREN (1815-89). An English scientist. He was born in Guern-

sey, educated in Paris, and devoted his leisure hours to scientific research, especially in the fields of chemistry and electricity. Between 1836 and 1848 he published several articles on these subjects, and in 1850 he constructed a large reflecting telescope at Canonbury, moving it later to Cranford, Middlesex. He introduced important improvements in oil-refining, color-printing, and envelope-folding machines, but his importance is due chiefly to pioneer work in photographing the heavenly bodies. He was president of the Royal Astronomical Society from 1864 to 1866. He published: *On Celestial Photography in England* (1859); *Researches on Solar Physics*, with Balfour Stewart and B. Loewy; and a number of papers and lectures on astronomy and physics.

**DE LA TORRE**, DUKE. See SERRANO Y DOMINGUEZ.

**DE LA TOUR**, de la tōor, MAURICE QUENTIN. See LA TOUR, MAURICE QUENTIN DE.

**DELA TTE**, de-la'tr', ALBERT LOUIS (1850- ). A French archaeologist, born at Déville-les-Rouen. Sent as a missionary to Algeria, he became chaplain of the church of St. Louis of Carthage (q.v.) and conservator of the archaeological museum at Algiers. His investigations among the ruins of ancient Carthage have been very valuable. He became director of the Musée Lavignier de Saint-Louis de Carthage, founded through his efforts in 1875. His works include: *Carthage et la Tunisie au point de vue archéologique* (1883). *Inscriptions de Carthage* (1884-85). *Souvenirs de la croisade de Saint Louis trouvés à Carthage* (1888). *Les tombeaux puniques de Carthage* (1890). *Souvenirs de l'ancienne église d'Afrique* (1893). *Musée Lavignier de Saint-Louis de Carthage* (3 vols., 1899-1900). For his articles in periodicals, consult Marquis d'Anselme de Puisaye, *Etude sur les diverses publications du Révérend Père Delattre* (Paris, 1895).

**DELA TTE**, ROLAND. See LASSO, ORLANDO DI.

**DELAUNAY**, de-ló'ná', CHARLES EUGÈNE (1816-72). A French astronomer and mathematician. He was professor of mechanics in Paris and a member of the Academy and succeeded Leverrier as director of the Observatory in 1870. He published: *Sur une nouvelle théorie analytique du mouvement de la lune* (1846). *Rapport sur les progrès de l'astronomie* (1867). *Cours élémentaire d'astronomie* (6th ed., 1876). *Traité de mécanique rationnelle* (7th ed., 1883). His *Théorie de la lune* (2 vols., 1860-67) was left unfinished at his death. Consult Thevenot, *Biographie de C. E. Delaunay* (Paris, 1878).

**DELAUNAY**, (JULIEN) ELIE (1828-91). A French mural and portrait painter. He was born in Nantes and was the pupil of Lamoignon and Flandrin in the Ecole des Beaux-Arts. He is known chiefly for his mural paintings in the foyer of the Opera House, the Hôtel de Ville, the church of La Trinité, and the Panthéon in Paris. The paintings in the Panthéon, representing scenes from the life of Saint-Genevieve, he did not live to complete. Among his best works are: "The Last Supper" (1861); "The Plague at Rome" (1869), a water color called his masterpiece; "The Communion of the Apostles"; "Diana," a fine nude—all in the Luxembourg; "The Death of the Centaur Nessus" (Nantes Museum). His later years were devoted almost entirely to portrait painting. Of

this kind his "Mother" (Luxembourg) and "Mademoiselle Toulmouche" are among his best canvases. His work is characterized by great attention to form, firm modeling, and a noble, rather severe style of composition. His color was at first hard, but later showed fantastic yet harmonious effects. He was awarded a first-class medal at the Paris Exposition of 1878 and the medal of honor in 1889. In 1878 he became an officer of the Legion of Honor and the following year was made a member of the Institute.

**DE LAUNAY, EMANUEL L. H.** See AN-TRAIGUES.

**DELAUNAY, LOUIS ARSÈNE** (1826-1903). A French actor, born in Paris. He made his first appearance at the Odéon in 1846 and for two years was engaged there as leading juvenile. In 1848 he appeared as Dorante in *Le Menteur* at the Théâtre Français and in 1850 became a regular member of that theatre. In 1877 he was appointed professor of dramatic declamation at the Conservatoire. He received the decoration of the Legion of Honor in 1883 and retired from the stage in 1887. He was one of the most accomplished of French actors, finding his parts in the plays of Augier, De Musset, Victor Hugo, and Pailleron.

**DELAUNAY, MARGUERITE JEANNE.** See STAAL.

**DE LAUNE, de lôn, ETIENNE.** See LAUNE, OF LAUNE, ETIENNE DE.

**DE LAVAL, de la-val', CARL GUSTAF PATRIK** (1845- ). A Swedish inventor and engineer, born at Blåsenborgs, Dalarna, Sweden. In 1866 he graduated from the Institute of Technology at Upsala, where he took his doctor's degree in philosophy in 1872. For the next five years he was occupied with various building operations, such as constructing sulphur refineries, copper smelters, glass works, and other industrial plants, but after 1877 he devoted himself exclusively to inventions. In 1878 he patented a cream skimmer, and in the following year he put on the market his continuous centrifugal cream separator. For the manufacture of this machine a large factory was built at Stockholm, and the contrivance was soon known all over the world. In 1883 he made the first successful steam turbine (see STEAM TURBINE), and after further experiments with his invention he constructed in 1892 a steam motor that made 30,000 revolutions a minute. His flexible shaft, which overcame the greatest obstacle in the use of the high-speed turbines, constitutes one of the most original and daring inventions in the field of mechanical science. He also invented a steam boiler that was able to withstand more than 100 atmospheres' pressure. His lactator, a perfected milk separator, was not received into practical use. In 1894 he was chosen as representative for Kopparsberg in the First Chamber. In 1886 he became a member of the Academy of Sciences (whose gold medal he received in 1892) and in 1896 an honorary member of the Agricultural Academy.

**DEL'AVAN.** A city in Walworth Co., Wis., 62 miles southwest of Milwaukee, on the Chicago, Milwaukee, and St. Paul Railroad, and on Rock River (Map: Wisconsin, E G). It is the seat of the State School for the Deaf and contains a public library. The city is noted for its mineral springs and, with Delavan Lake in the vicinity, is a popular place of resort. There are some manufactures of knit goods. The

water works are owned by the city. Pop., 1900, 2244; 1910, 2450.

**DELAUVIGNE, de-la-vé'ny', JEAN FRANÇOIS CASIMIR** (1793-1843). A French lyric poet and dramatist, born in Havre, April 4, 1793. His first important writings were dithyrambic poems, *Les messénienes* (1818), antique in form, but present and direct in their allusions to the disasters of the last Napoleonic years. These gave stirring expression to popular emotions, especially to the rancor and fears of the Liberals at the reactionary rule of the restored Bourbons. They achieved sensational success. In 1819 he turned the same talent to celebrate Joan of Arc, thus appealing to a universal patriotic sentiment before either Hugo or Lamartine had begun to touch the French heart with their Napoleonic verses. The forerunner should not be forgotten in the greatness of his successors, and in drama Delavigne is important to the continuity of historic development. He stands between Beaumarchais and Emile Augier, almost the sole talented representative of dignified comedy, and his dramatic work, taken chronologically, represents almost every phase of the conversion of a strict Classicist into a moderate Romanticist. However, his lack of genuine, forceful inspiration and enthusiasm caused his works to be relegated to the second rank, especially when compared with those of the more buoyant geniuses of the Romantic school. His *L'Ecole des vieillards* (1823) still holds the boards by its lively dialogue, graceful style, and ingenious invention. *Marino Falieri* (1820) anticipates the Hugo-esque mingling of tragic and comic elements, preserving an academic correctness of form without following the classic rules. Other plays still occasionally acted and often read are: *Les sœurs suédoises* (1819), *Louis XI* (1832); *Les enfants d'Edouard* (1833); and *La fille du Cid* (1839). Delavigne was elected to the Academy in 1825 and in 1830 rose to the political occasion, as he had done after Waterloo. His song, "La Parisienne," set to music by Auber, rivaled for a time the "Marseillaise" itself, and "La Varsoivienne" was sung as a battle march by the rebelling Poles. Indeed, it is as a poet of politics, a man of the hour, that Delavigne is at his best. At times very popular, he needed striking occasions to evoke his genius. When he became contemplative, he was commonplace, but in direct appeal he wrote with terse vigor. His private life was above reproach. He died in Lyons, Dec. 11, 1843. His complete works were published in 1870 in four volumes. Consult Ed. Sambuc, *Casimir Delavigne* (Paris, 1893), and N. M. Bernadín, *Devant le Rdcau, conférences dramatiques* (ib., 1901).

**DEL'AWARE.** One of the thirteen original States of the United States, constituting one of the Middle Atlantic States (Map: United States, L 3). It lies between lat. 38° 30' and 39° 45' N. and long. 75° and 75° 50' W. It is bounded on the north by Pennsylvania, on the east by the estuary of the Delaware River and by Delaware Bay, which separate it from New Jersey, and by the Atlantic Ocean; on the south and west by Maryland. It has a total area of 2370 square miles, of which 1965 square miles is land and 405 square miles is water surface. It has a length of about 96 miles from north to south, with a greatest width of 35 miles and a least width of 9 miles.

At the entrance to Delaware Bay is Cape Henlopen, opposite Cape May, N. J.

The State of Delaware forms a portion of the Middle Atlantic slope, being embraced largely within the physiographic province of the coastal plain, although somewhat over 100 square miles in the northern part of the State fall within the piedmont plateau province. This latter area, which consists of rolling country, reaches an elevation of 488 feet at Centerville, near the northern border of the State. The streams flow with rapid currents until they pass the "fall line," where they continue with sluggish courses or empty into tidal estuaries. The coastal plain consists of a broad terrace upland of low elevation, known as the Wicomico terrace, which rises from about 60 feet in the southern part of the State to somewhat over 100 feet in the northern part and constitutes the divide between the streams. This is followed by a low terrace, known as the Talbot terrace, which surrounds the shores of the Delaware River and Bay and extends up the various stream channels, reaching an elevation along the landward margin of about 40 feet, from whence it slopes gradually to tide level at most points. The streams of Delaware, while numerous, are all small. In the northern part of the State the streams flow in an easterly or southeasterly direction across it from Pennsylvania and Maryland and empty into the Delaware. Nearly all the State, however, lies on the peninsula between Delaware and Chesapeake bays, and the divide between their waters traverses the States from north to south, keeping at a uniform distance from the east coast. Thus, as Delaware broadens southward, a relatively greater part of it lies west of the divide in the south than in the north. None of these rivers are navigable, although the estuary-like mouth of Christiana Creek permits the ascent of vessels to Wilmington. The Delaware coast of Delaware Bay and the estuary of Delaware River offer few advantages in the way of harbors. Portions of the shore are marshy, and the only good harbors are at Lewes, Wilmington, and New Castle. The Delaware Breakwater has been constructed at great expense near the mouth of the bay, in order to remedy somewhat this deficiency of safe harbors. On the southern border of the State there is an area of swamp land covering 70 square miles.

On the Atlantic coast there are a number of shallow bays or lagoons separated from the ocean by sandy reefs; the shallowness of their entrances, however, limits their usefulness. The largest bays are Rehoboth and Indian River bays, which have a common outlet known as Indian River Inlet, which permits navigation by vessels drawing less than six feet of water.

**Climate and Soil.** Situated on the east coast of the continent, Delaware has a temperate climate, with a considerable range of temperature and an ample rainfall.

The average annual temperature is about 55° F., varying from 56° at the extreme south to about 52° at the extreme north. The average daily range of temperature, or difference between the highest and lowest temperatures during 24 hours, is from 16° F. to 20° F. The highest summer temperature on record is 103° F. and the lowest winter temperature —17° F.; even in midsummer the temperature has descended to 50° F. On the average August day the temperature rises to about 85° F., and on

the average January day the temperature descends to 25° F. In the fall frosts seldom occur before October 10 and may not occur until about November 1, while in the spring they may occur as late as the latter part of April. The advent of spring (i.e., the awakening of plant life) occurs on the average about the end of March.

The annual rainfall is, on the average, from 40 to 45 inches over the State as a whole, but is slightly greater on the coast than inland. The rainfall is rather evenly distributed over the whole year, although there seems to be somewhat less precipitation in late fall and early winter than at other seasons of the year. Damaging droughts are not infrequent, but killing droughts are unknown. Heavy rainfalls take place, sometimes an average month's rainfall occurs in a single day, but damaging rainstorms are rare. Thunderstorms and hailstorms are most frequent from May to August. The prevailing winds are from the northwest from October to May, from the southwest in June and July, and variable during the intervening spring and fall months.

The soils of Delaware are dependent on the underlying geological formations from which they are derived, those of the north in the piedmont plateau belt coming from the underlying crystalline rocks and presenting considerable variation on account of the diversity of their mineral constituents. They possess much less importance from an agricultural standpoint than those farther south derived from the sedimentary deposits comprising the coastal plain. Several well-marked types have been described, the most important being the Sassafras loam, which occupies the high levels of the Wicomico terrace, this soil being well adapted for wheat, corn, and tomatoes, and also affording largely the soil on which the famous peach orchards of Delaware and Maryland are located. Another important soil is the Norfolk sand, covering large areas on both the Wicomico and Talbot terraces and being chiefly employed for the production of early truck crops, including vegetables and small fruits not only in Delaware but throughout the coastal plain district from Long Island to Cape Hatteras. The Portsmouth sand, formed under similar conditions but where the country is less well drained, is well adapted for late truck crops. Many other soil types, including the Elkton clay, Susquehanna clay, and gravel, occupy smaller areas, but are of much less importance from an agricultural standpoint. The important soils described above are derived directly from the underlying Pleistocene formations, while the latter are in part derived from the sub-jacent Cretaceous beds.

**Geology and Mineralogy.** The northern part of the State has been already described as falling within the area of the piedmont plateau, this district being underlain by crystalline rocks of various kinds, both of sedimentary and eruptive origin; the former consisting of gneiss, mica schist, and limestone, and the latter of granite, apophyllite, serpentine, and gabbro with dikes of pegmatite and diabase. Overlying this piedmont plateau complex of crystalline rocks are the coastal-plain formations which comprise representatives of the Cretaceous and Pleistocene periods. The strata are for the most part unconsolidated and consist of marls, clays, sands, and gravels, the total thickness of the deposits in cer-

tain parts of the area being less than 1000 feet. Clays suitable for the manufacture of brick and terra cotta, and kaolin, are found in the vicinity of Wilmington. A small area of granite occurs near this city, from which building stone and road material are quarried, and some feldspar has been extracted. Glass sand, marls, and bog-iron ore are known to form extensive deposits.

**Mining.** The mineral resources of the State are limited to its quarries, its clay, sand, and gravel pits, and its mineral waters. All of these are of little importance compared with those of other States. The total mineral production of Delaware in 1912 was valued at \$425,360, of which \$193,074 was represented by the output of the stone quarries and \$162,216 by the clay products.

**Agriculture.** Delaware ranks forty-seventh in both area and population among the States. Although a considerable portion of its population lives in a manufacturing centre, it is a distinctly agricultural State. As most of it is part of the Atlantic coastal plain, as a whole it is level and easily tilled. Between 1900 and 1910 there was an increase of 9.5 per cent in population, while the number of farms increased 11.9 per cent. In the same period there was a decrease of over 2.6 per cent in the acreage of farm land and a decrease of 5.4 per cent in the improved land in farms. The total number of farms in the State in 1910 was 10,836, compared with 9687 in 1900. Of an approximate area of 1,257,600 acres, there were in farms, in 1910, 1,038,866 acres, compared with 1,066,228 in 1900. The improved land in farms in 1910 amounted to 713,538 acres, compared with 754,010 acres in 1900, a decrease of 40,472 acres in the decade. The average acres per farm decreased from 110.1 in 1900 to 95.9 in 1910. The total value of farm property which includes land, buildings, implements and machinery, domestic animals, poultry and bees, was \$63,179,201, in 1910, compared with the value in 1900 of \$40,697,654, an increase in the decade of \$22,481,547, or 55.2 per cent. The average value of all property per farm in 1910 was \$5830, compared with \$4201 in 1900, while the average value of land per acre increased from \$22.29 in 1900 to \$33.63 in 1910.

Of all the farms in the State in 1910 (10,836), 6301 were operated by owners and managers and 4535 by tenants. About 42 out of each 100 farms were operated by tenants. In 1890 and in 1900 the proportion was even higher; in the latter year it amounted to slightly more than 50. The fluctuations in the number and proportion of farmers who are tenants arise mainly from the changes among the share tenants. The number of cash tenants has increased slowly since 1880. Share and share-cash tenancy, on the other hand, increased rather rapidly for 20 years, but decreased considerably during the decade 1900-10, and among colored farmers the proportion increased slightly.

Of the owned farms in 1910, numbering 6178, 3817 were free from mortgage, while 2264 were mortgaged. The total amount of the mortgage debt was \$3,068,721, while the value of the land and buildings mortgaged was \$8,801,976. The average debt per farm was \$1518 in 1910, compared with \$2147 in 1890, while the average equity per farm in 1910 was \$2837 in 1910 and \$2728 in 1890.

Over half the farms in the State are between

50 and 174 acres in size, and nearly three-fourths are between 20 and 174 acres. Slightly over nine-tenths of the farm operators in 1910 were whites and nearly one-tenth colored. The total number of native white farmers was 9504, and of negro and other non-white, 922. The foreign-born white farmers numbered 410, of whom nearly one-third were born in Germany.

The total value of the crops in 1909 was \$9,121,809, against \$6,275,360 in 1899. Combined acreage of crops was 438,522, representing 61.5 per cent of the total improved land in farms (713,538 acres). The general character of the agricultural products is indicated by the fact that about one-half, or 51.4 per cent of the total value, in 1909 was contributed by the cereals; about one-fifth by potatoes and other vegetables, and about one-eighth by hay and forage; the remainder, representing 15.6 per cent of the total, consisted chiefly of small fruits, forest products, orchard fruits, and nuts. The following table gives the acreage, production, and value of the principal crops in 1913 and in 1909. The figures for 1913 are estimates by the United States Department of Agriculture, while those for 1909 are from the thirteenth census.

		Acreage	Prod bu	Value
Corn	1913	197,000	6,206,000	\$3,662,000
	1909	188,755	4,839,548	2,903,442
Wheat	1913	133,000	1,638,000	1,441,000
	1909	111,215	1,643,572	1,667,539
Oats	1913	4,000	122,000	62,000
	1909	4,226	98,239	51,022
Rye	1913	1,000	14,000	11,000
	1909	1,017	11,423	8,169
Potatoes	1913	11,000	957,000	718,000
	1909	9,703	890,300	453,400
Sweet potatoes and yams	1913	5,000	675,000	405,000
	1909	5,229	733,746	276,679
Hay	1913	72,000	94,000*	1,476,000
	1909	80,669	103,575	1,174,473

\* Tons.

The leading crops in the order of their importance are corn, wheat, hay and forage, potatoes, and sweet potatoes and yams. Potatoes, sweet potatoes and yams, and dry peas are the only crops outside of cereals and hay and forage which have any considerable acreage. There has been a considerable fluctuation in the acreage of corn. In the last 30 years the decrease in the acreage of oats has been marked. The acreage of wheat, on the other hand, has made a considerable gain since 1870, though it decreased slightly during the decade 1900-10. The acreage of hay and forage nearly doubled in the same period, and that of sweet potatoes and yams more than doubled. The State is an important producer of orchard and tropical fruits. The total value of these in 1909 was \$199,766, and the quantity produced was 309,274 bushels. The production of orchard fruits greatly decreased in the decade 1899-1909, while the production of grapes increased. The value of all orchard fruits in 1899 was \$263,000, while the value of grapes increased from \$31,701 in 1899 to \$43,967 in 1909. The most important of the orchard fruits is apples, of which there were grown 183,094 bushels in

1909, with a value of \$115,371. Pears ranked next in value, with 105,357 bushels, valued at \$52,022; peaches and nectarines, 16,722 bushels, valued at \$21,402. Other fruits of less importance are plums, prunes, and quinces. Of much greater value than the orchard fruits are small fruits. There were produced of these, in 1909, 14,425,209 quarts, valued at \$649,732. Strawberries are by far the most important of the small fruits. The production in 1909 was 12,730,265 quarts, valued at \$569,354. Blackberries and dewberries rank next in value. The total acreage of small fruits in 1909 was 8687, a decrease from 10,599 in 1899. The value of all vegetables other than potatoes and sweet potatoes and yams in 1909 was \$1,102,620. The raising of flowers and plants and nursery products is of the same importance. The total output in 1909 was valued at \$110,486.

**Live Stock and Dairy Products.** The total value of the live stock on the farms of the State in 1910 was \$6,817,000. This includes domestic animals, poultry, and bees. The cattle numbered 54,986, with a value of \$1,648,333; horses, 33,065, valued at \$3,451,791; mules, 6935, valued at \$764,133; swine, 49,260, valued at \$337,910; sheep, 7806, valued at \$36,898. The total number of fowls of all kinds was 876,081, valued at \$560,146. The estimates of live stock on Jan. 1, 1914, as given by the United States

000, valued at \$597,000; horses, 35,000, valued at \$3,710,000; mules, 6000, valued at \$756,000. The number of dairy cows on April 15, 1910, was 35,708. The milk sold in 1910 was 4,425,909 gallons, valued at \$665,953. The butter sold amounted to 1,024,945 pounds, valued at \$277,202. The total value of milk, cream, and butter fat sold, and butter and cheese made, in 1909 was \$1,089,497.

**Forest Products.**—There were 5429 farms in the State in 1909 which reported forest products, the total value of such products being \$346,062, as compared with \$250,481 in 1899. Of the value in 1909, \$180,061 was reported as that of products used or to be used on the farms themselves, \$101,814 as that of products sold or for sale, and \$64,187 as the amount received for standing timber. Forest products not produced on farms are not included in these figures.

**Manufactures.** Although, as noted above, the chief industry of the State is agriculture, its manufacturing interests are important. The transportation facilities of Delaware are excellent, as no part of the State is removed from navigable water, and its location gives it direct railroad connection with the large railway systems in the East. There is but one city having a population of over 10,000, Wilmington, with a population of 87,411. The following table

## COMPARATIVE SUMMARY FOR 1909 AND 1904

THE STATE—ALL INDUSTRIES COMBINED AND SELECTED INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY					Primary horse power	Capital	Salaries	Wages	Cost of materials	Value of products	Value added by manufacture
			Total	Proprietors and firm members	Salaried employees	Wage earners (average number)								
Expressed in thousands														
STATE—All Industries	1909	726	23,984	722	2,024	21,238	52,779	\$66,906	\$2,322	\$10,296	\$30,938	\$52,840	\$21,992	
	1904	631	20,567	641	1,451	18,475	49,499	50,226	1,629	8,158	24,884	41,160	16,276

\* Excluding statistics for one establishment, to avoid disclosure of individual operations.

Department of Agriculture, was as follows: cattle, other than milch cows, 19,000, valued at \$555,000; milch cows, 39,000, valued at \$2,028,000; sheep, 8000, valued at \$41,000; swine, 58,

gives the most important facts relative to manufactures in the State in 1909, compared with 1904. Only such industries as had a product valued at \$1,000,000 or over in 1909 are

included. From this table it will be noted that there were, in 1909, 726 manufacturing establishments which gave employment to an average of 23,984 persons during the year and paid out \$12,618,000 in salaries and wages. The products of these establishments were valued at \$52,840,000, to produce which materials costing \$30,938,000 were utilized. The value added by manufacture was thus \$21,902,000, which figure best represents the net wealth created by manufacturing operations during the year.

In general, this table brings out the fact that the manufacturing industries as a whole showed a considerable increase in the period 1904-09. During this period the number of establishments increased 15.1 per cent, and the average number of wage earners 15 per cent, while the value of products increased 28.4 per cent and the value added by manufacture 34.6 per cent. The most important industries, in the order of their importance, are those connected with the manufacture of leather, those relating to foundry and machine-shop products, cars and steam railroads, paper and wood pulp, canning and preserving, shipbuilding, flour and gristmill products, iron and steel, steel works and rolling mills, and lumber and timber products. The leather industry showed a greater rate of increase from 1904 to 1909 in the value added by manufacture than any other of the specified industries. The steam-railroad repair shops and the canning and preserving industry also showed remarkable increases both in value of products and in value added by manufacture. The total number of persons engaged in the manufacturing industries in 1909 was 23,984. Of these, 21,248 were wage earners. The male wage earners numbered 17,505, and the female 3733. There were 529 wage earners under 16 years of age, of whom 300 were male and 229 female. Nearly all the women and children are employed in canning and preserving. For the great majority of wage earners the prevailing hours of labor range from 54 to 60 hours a week, or from 9 to 10 hours a day, only 8 per cent of the total employed in establishments working less than 9 hours a day and only 4.5 per cent in establishments working more than 10 hours a day.

The manufacturing industries are largely centralized in the city of Wilmington. In 1909, 72 per cent of the total value of products was reported from this city, and 69 per cent of the average number of wage earners were employed there. Between 1899 and 1909 the districts outside of Wilmington gained slightly more in the value of manufactures than did the city itself. This is due to the fact that two of the largest and most important industries—canning and preserving and lumber and timber products—are conducted entirely outside of Wilmington.

**Fisheries.** The fisheries of Delaware are not important. The value of the products for the year ending Dec. 31, 1908, was only \$541,200. Of this the largest in point of value and amount was menhaden. The value of this fish taken was \$151,790, and the amount 59,815,400 pounds. Next in order of importance were oysters, of which 154,600 bushels with a value of \$111,990 were taken. Of oysters for seedling purposes, 193,200 bushels, valued at \$56,620, were caught. Following in order of importance

were shad, 869,800 pounds, valued at \$67,860; squeteague, or sea trout, 2,500,000 pounds, valued at \$29,190; crabs, 3,178,300 pounds, valued at \$13,390. Among other fish caught are striped bass and catfish. In 1908 there were 65 vessels employed in the fisheries of the State, and these were valued at \$679,565. The number of independent fishermen were 853, and the wage-earning fishermen employed numbered 903.

**Transportation.** The State has good facilities for transportation, both by land and by water. Two important railroads pass through it, the Pennsylvania and the Baltimore and Ohio. The Wilmington and Northern Railroad is leased by the Philadelphia and Reading Railway Company. The longest mileage is that of the Pennsylvania road, which has 275 miles. The total railway mileage in 1913 was about 400. There is no State railway commission. The Chesapeake and Delaware bays are connected by a canal  $13\frac{1}{2}$  miles long, 66 feet wide, and 10 feet deep. This work was completed in 1889 at a cost of \$2,253,000. Wilmington has considerable coast-wise traffic, and it is a customs district. The city is connected with New York by a line of steamers. In recent years the government has made appropriations for improving Wilmington harbor and for dredging a channel in several of the larger streams of the State. A massive breakwater at Lewes was begun in 1837 and was completed in 1869 at a cost of over \$2,000,000. The mileage of electric railways on Dec. 31, 1912, was 110.37.

**Banks.** There were on June 14, 1913, 25 national banks in Delaware. These had a capital of \$1,689,000, deposits subject to check of \$8,224,000. There were also four State banks with a capital of \$520,000, deposits subject to check of \$1,514,083, and savings deposits amounting to \$625,345. On June 4, 1912, there were two savings banks with 33,575 depositors and deposits amounting to \$10,800,113. In addition there were 16 loan and trust companies with deposits subject to check amounting to \$7,705,193 and savings deposits amounting to \$957,408.

**Population.** The population of Delaware from 1790 is as follows: 1790, 59,000; 1820, 72,700; 1850, 91,500; 1860, 112,200; 1870, 125,000; 1880, 146,600; 1890, 168,500; 1900, 184,700; 1910, 202,322. The estimated population in 1914 was 209,817. The ratio of increase in the decade 1900-10 was 9.5 per cent, as compared with 21 per cent for the entire country. The white population in 1910 was 171,102, compared with 153,977 in 1900. The negro population in 1910 was 31,181, compared with 30,697 in 1900. The native-born population in 1910 was 184,830 and the foreign-born 17,492. Of the white population, 127,809 were of native parentage, 17,566 of foreign parentage, and 8307 of mixed parentage. Wilmington is the only city in the State having over 25,000 inhabitants. Its population in 1910 was 87,411, compared with 76,508 in 1900. Other cities with their populations in 1910 and 1900 are Dover (the capital), 3720, 3229; Milford, 2603, 2500; New Castle, 3351, 3380.

**Education.** Educational conditions in the State are far from satisfactory, but the people and the Legislature have evidenced a determination to remedy them. The Legislature of 1907 passed a compulsory education law by which all children between the ages of 7 and 14 are re-

quired to be sent to school. This law was amended in 1909. The Legislature of 1911 abolished the existing State Board of Education and established a new State board with wider powers. This board is composed of seven members, who serve without compensation. The Legislature of 1913 gave the Governor the power to appoint a State Commissioner of Education who would also be the secretary of the State Board of Education. The term of this officer is for two years, and the first appointment made was on May 1, 1913. The present law under which the public schools are administered dates from 1898. Successive legislatures since that time have amended these laws. Provision has been made for the establishment of free public libraries in schools and for moral and humane education. Measures have also been passed providing for the improvement of schoolhouses for colored children and for the consolidation and uniting of school districts for colored people. Although there are no normal schools in the State, provision is made for the attendance of a certain number of persons at normal schools in other States.

Authoritative statistics in regard to school enrollment, attendance, etc., are not available for a date later than 1910. In that year the total school population between the ages of 6 and 20 was 57,932. The total number of persons attending school in the same year was 35,304. Of these 23,789 were of native white parentage, 5103 of foreign-born or mixed parentage, and 5815 negroes.

Out of a population of 163,080 of 10 years of age or over, in 1910, 13,240, or 8.1 per cent, were illiterate. In 1900 the number was 17,531 and the percentage 12. Among persons of native parentage there were 3302, or 3.3 per cent, illiterates in 1910, while for the negro population the total number of illiterates in 1910 was 6345, or 25.6 per cent. The illiterates among the negroes in 1900 numbered 8967, or 38.1 per cent, of the colored population. In 1912 there were 23 public high schools, with total enrollment of 1928 white and 177 colored students. The average length of the school term in 1910 was 172.5. In the same year there were 993 teachers employed, of whom 857 were women and 136 men. The average monthly salary of men teachers in 1910 was \$78.40, and for women teachers \$38.76. The total amount expended for schools in the same year was about \$600,000. The only institutions for higher education are Delaware College for men at Newark, St. Joseph's Industrial School (Roman Catholic) at Clayton, and a State College for Colored Students at Dover. The last-named institutions are both for colored students.

**Charities and Corrections.** The State has no board in direct supervision of charitable and correctional institutions. The list of such institutions which are partially supported by appropriations by the State or county are as follows: State Hospital for the Insane, Farnhurst; New Castle County Hospital, Farnhurst; Ferris Industrial School, Marshallton; Delaware Industrial School for Girls, Wilmington; Delaware Orphans' Home for Colored Children, State Road. There are in addition several private institutions which receive appropriations from county or State. These include the Home for Aged Women at Wilmington, the Crittenton Home at Wilmington, and the Home for Friendless Children at Wilmington. Supervision of

the blind in the State is in the hands of the Delaware Commission for the Blind. There are, in addition to these, private hospitals and other institutions. A large part of the supervision of the public and semipublic institutions is in the hands of the Associated Charities at Wilmington. The Legislature of 1911 provided for the appointment by judges of the Superior Court of a probation officer to act for the whole State and for a juvenile court at Wilmington. Commissions were appointed by the same Legislature to report on child labor. This report was made to the Legislature of 1913, and a measure was enacted regulating the hours of labor for females, making a maximum of 10 hours per day or 55 hours per week in certain employments.

**Militia.** The organized militia comprises one regiment of infantry and one detachment of sanitary troops. The enlisted men on Jan. 1, 1913, numbered 441, and the officers 41. The designation is the Organized Militia of Delaware.

**Finance.** The report of the State Treasurer for the fiscal year 1913 shows receipts from all sources for that year of \$676,953. The disbursements for the same period were \$707,158. At the beginning of the fiscal year there was a balance of \$92,347, leaving a balance at the end of the fiscal year 1913 of \$61,749. The chief sources of revenue are licenses and fees from clerks of the peace, insurance and banking department, railroads, State corporation and franchise taxes, and the collateral inheritance tax. The chief expenditures are for education, charities, State institutions, highways, executive and judicial departments, public health, agriculture, legislature, and public defense. The bonded debt of the State at the end of the fiscal year 1913 was \$826,785. The Legislature of 1911 appointed a revenue and tax commission which was to report to the Legislature of 1913. A revenue law passed in the same session requires manufacturers to pay for an annual license and make an annual report.

**Religion.** The leading religious denominations are the Methodist Episcopal, Roman Catholic, Presbyterian, Protestant Episcopal, and Baptist. Wilmington is the see of the Protestant Episcopal diocese of Delaware and of the Roman Catholic diocese of Wilmington.

**Government.** Delaware has been governed under four constitutions. The first was adopted in 1776, the second in 1792, the third in 1831, and the present in 1897. The last named has been several times amended, but the amendments are not of great importance. Amendments may be proposed in the Senate or House of Representatives, and if two-thirds of each House vote for such amendment it must be published three months before the next general election. If the General Assembly next held after this election agrees to the amendment by a two-thirds vote, it becomes a part of the constitution. The General Assembly by a two-thirds vote has the power to provide for the submission to the electors at the general election next thereafter the question "Shall there be a convention to revise the constitution and amend the same?" If a majority of electors voting on the question shall decide in favor of a convention, the General Assembly at its next session shall provide for the election of delegates to such a convention at the next general election.

**Legislature.**—The legislative power of the State is vested in the General Assembly, consisting of the Senate and House of Representa-

tives. The House of Representatives is composed of 35 members chosen for two years. The Senate is composed of 17 members who are chosen for four years. The Legislature meets biennially.

**Executive.**—Executive officers include Governor, Lieutenant Governor, Attorney-General, Insurance Commissioner, State Treasurer, and Auditor of Accounts. The terms of the Governor and Lieutenant Governor, Attorney-General, and Insurance Commissioner are four years, and those of the State Treasurer and Auditor of Accounts are two years. The Governor may not be a candidate a third time for office.

**Local and Municipal Government.**—The hundred, or township, is the unit of local government. The city of Wilmington is governed by a modified-commission form of government, including the initiative and referendum. This was authorized by the Legislature of 1907. Sheriffs are elected for a term of four years and are not eligible for a second term.

Prior to 1913 there was a primary law which applied only to New Castle County. The Legislature of that year extended this law to Kent and Sussex counties, thereby covering the entire State. This primary law provides for the nominations of county officials, members of the General Assembly, and the election of delegates to the respective party nominating conventions.

**Judiciary.**—The judicial powers of the State are vested in a supreme court, a superior court, a court of chancery, an orphans' court, a court of oyer and terminer, a court of general sessions, and a registers' court. There are six State judges, one of whom is chancellor, one chief justice, and the other four associate justices. The chancellor, chief justice, and associate justices are appointed by the Governor and confirmed by the Senate. The term of service is 12 years. By an amendment adopted in 1913 the chief justice and the four associate justices compose the supreme court, the court of general sessions, and the court of oyer and terminer. The chancellor presides over the court of chancery. The orphans' court in each county consists of a chancellor and a resident associate judge of the county.

**Suffrage and Elections.**—Every male citizen of the age of 21 years and over who has been a resident for one year next preceding an election and for the last three months a resident of the county and for the last 30 days a resident of the hundred, or election district, in which he may offer to vote and in which he shall have been registered, is entitled to vote. Each voter, however, is required to be able to read the constitution of the State in the English language and to write his name. Prior to 1907 each voter at the time of his registration was required to pay a fee of \$1 for the use of the county wherein the registration was made. The Legislature in the year noted passed an amendment abolishing this provision.

General elections are held biennially on the Tuesday next after the first Monday in the month of November. The Legislature has passed several measures providing for the secrecy and purity of the ballot. The constitution contains strong provisions against giving or receiving bribes for voting.

**History.** The aboriginal inhabitants of the region belong to the Lenni Lenape family, but Iroquois hunting parties frequently traversed the country. The name "Delaware" was first

applied to the bay which Lord de la Warr entered in 1611. Mey, a Dutch explorer, built Fort Nassau near the site of Philadelphia in 1623, and in 1631 a Dutch company, headed by De Vries, established a colony on Lewes Creek, near Cape Henlopen, which the Indians destroyed. In 1638 Swedes erected a fort on Christiana Creek, named the country New Sweden, and subsequently established a military post on the island of Tinicum, below Philadelphia. The Dutch considered this an invasion of their territory and set up Fort Casimir, near the site of the present New Castle. A settlement on the Delaware, made in 1641 near the present site of Salem, N. J., by a colony from New Haven, existed for only two years. After 1642 the Swedes and the Dutch came into open conflict. The Swedes took Fort Casimir in 1654, but were driven out in the following year by the Dutch, who seized the whole country. When New Netherlands came into the possession of the English, the settlements on the Delaware were claimed both by the Duke of York and by Lord Baltimore. In 1683 William Penn received the territory in fee from the Duke of York and effected a compromise with Lord Baltimore, and for 20 years Delaware was governed as a part of Pennsylvania under the name of the "Territories or Three Lower Counties on the Delaware," each county sending six representatives to the General Assembly. In 1703 Delaware established a separate legislature, but continued to acknowledge the authority of the Governor of Pennsylvania till the Revolution. In the War of Independence the "Blue Hen's Chickens," as the Delaware volunteers were called, rendered efficient service. The State was the first to ratify the Federal Constitution, Dec. 7, 1787.

Though a slaveholding State, Delaware remained faithful to the Union in 1861 and contributed nearly 14,000 troops to the Federal armies. In the southern part of the State, however, the Confederate sentiment was strong, and large numbers went to join the forces of the South. The Fourteenth Amendment was denounced by the Legislature, and though no forcible attempts were made, as in the South, to hamper the negroes in the exercise of their newly acquired civil and political rights, the feeling of race hatred prevailed for a long time after the war.

The period since 1865 has witnessed a remarkable growth of the railway system, the development of the fruit industry, and the rise of Wilmington as a shipbuilding and manufacturing centre. The rapid growth of Wilmington in population since 1873 has created great opposition to the prevailing system of representation in the Legislature as being unfair to the inhabitants of that city. This is owing to the fact that the State representatives are apportioned arbitrarily among the three counties, with the result that New Castle County, containing the city of Wilmington, with an industrial population one and a half times that of the agricultural counties of Sussex and Kent, has always been in a hopeless minority. From 1788 to 1852 Delaware was a Federal or Whig State in national elections excepting in 1820, when it cast its vote for Monroe. Since 1852 it has been a Democratic State with the exception of the years 1872, 1896, 1900, 1904, and 1908. In State politics it was consistently Democratic from 1865 to 1869. The Republican party in the latter

year won a majority in the State Legislature, and from that time, with the exception of short periods, was in political control of the State until 1913. The period from 1893 to 1906 was marked by one of the most remarkable instances of the domination of a political party by one man that has occurred in the history of the United States. In consequence of the political ambitions of J. Edward Addicks (q.v.), the Republican party in the State was disrupted and corruption of the Legislature and electorate became notorious throughout the country. In the struggle between Addicks and the opposing faction the Legislature was several times deadlocked, and from 1901 to 1903 the State was without representation in the United States Senate. Not until June 13, 1906, when Henry A. Du Pont, representing the Regular Republicans, was elected to the Senate, did Addicks abandon the attempt to control the politics of the State and to have himself elected to the Senate. On the expiration of the term of Senator Allee in 1907, Harry A. Richardson was elected Senator.

In the presidential election of 1908 Taft received 25,014 votes and Bryan 22,071. In the presidential election of 1912 Wilson received 22,631 votes, Taft 15,997, and Roosevelt 8886. The Democrats elected all State officers except Governor, and elected also a majority of the Legislature, which insured the election of a Democrat as Senator in 1913 to succeed Senator Richardson. Willard Saulsbury was elected on Jan. 29, 1913, for the term expiring March 3, 1919.

The question of liquor regulation has been a troublesome one. The local-option law divides the State into four districts, one of which includes the city of Wilmington, another the rural part of New Castle County (in which is Wilmington), and the others Kent and Sussex Counties. In an election held in 1907 two of these districts voted for no license, and the other two for license. In the city of Wilmington and in rural New Castle County license was successful; while Kent and Sussex counties gave large majorities to no license. This resulted in the prohibition in these counties of all liquors except for sacramental and medicinal purposes. Suits brought to test the validity of the law under which these elections were held resulted in a decision of the Supreme Court sustaining them in 1908. The Legislature of 1909 passed a measure providing for a resubmission of the question of licensing the sale of liquors in rural New Castle County, which, with Wilmington, voted in 1907 for license. At an election held in November, 1910, voters of the rural portion of New Castle County again voted for license by a majority of 748, thus all New Castle County remained license, while Kent and Sussex counties continued no license. The State has one Representative in Congress, and three votes in the Electoral College.

Following is a list of the governors of the State from its first settlement to 1915:

#### COLONIAL GOVERNORS

(Swedish)

Peter Minuit	1638-40
Peter Hollander	1640-43
Johan Prints	1643-53
Johan Papegoza (acting)	1653-54
Johan Claudius Rising	1654-55

From 1655 to 1682 Delaware was under the rule of the Dutch and English governors of

New York, and from 1682 to 1776 its governors were those of Pennsylvania.

#### PRESIDENTS UNDER THE CONSTITUTION OF 1776

Johd McKunly	1777
Thomas McKean (acting)	1777
George Read (acting)	1777-78
Cesar Rodney	1778-81
John Dickinson	1781-82
John Cook (acting)	1782-83
Nicholas Van Dyke	1783-86
Thomas Collins	1786-89
John Davis (acting)	1789
Joshua Clayton	1789-93

#### STATE GOVERNORS

Joshua Clayton	Federalist	1793-96
Gunning Bedford	"	1796-97
Daniel Rogers (acting)	"	1797-99
Richard Bassett	"	1799-1801
James Sykes (acting)	"	1801-02
David Hall	"	1802-05
Nathaniel Mitchell	"	1805-08
George Truitt	"	1808-11
Joseph Haslett	"	1811-14
Daniel Rodney	"	1814-17
John Clark	"	1817-20
Jacob Stout (acting)	"	1820-21
John Collins	Dem.-Rep.	1821-22
Caleb Rodney (acting)	"	1822-23
Joseph Haslett	"	1823-
Charles Thomas (acting)	"	1823-24
Samuel Pavynter	Federalist	1824-27
Charles Polk	"	1827-30
David Hazard	"	1830-33
Caleb P. Bennett	Amer.-Rep	1833-36
Charles Polk (acting)	"	1836-37
Cornelius P. Comegys	Whig	1837-41
William B. Cooper	"	1841-45
Thomas Stockton	"	1845-46
Joseph Maull (acting)	"	1846-
William Temple (acting)	"	1846-47
William Tharp	Democrat	1847-51
William H. Ross	"	1851-55
Peter F. Causey	Whig-Know-Nothing	1855-59
William Burton	Democrat	1859-63
William Cannon	Republican	1863-65
Gove Saulsbury (acting)	Democrat	1865-67
Gove Saulsbury	"	1867-71
James Ponder	"	1871-75
John Cochran	"	1875-79
John W. Hall	"	1879-83
Charles C. Stockley	"	1883-87
Benjamin T. Biggs	"	1887-91
Robert J. Reynolds	"	1891-95
Joshua H. Marvel	Republican	1895-
William T. Watson (acting)	Democrat	1895-97
Ebe W. Funnell	"	1897-1901
John Hunn	Republican	1901-05
Preston Lea	"	1905-09
Simoon S. Pennewell	"	1909-13
Charles R. Miller.	"	1913-

Consult: Scharf, *History of Delaware* (2 vols., Philadelphia, 1888). Conrad, *History of the State of Delaware* (Wilmington, 1910). Messersmith, *Government of Delaware* (New York, 1910); Hassee, *Index of Economic Material in the Documents of the United States Delaware* (Washington, 1910); Pyle, *Once Upon a Time in Delaware* (Wilmington, 1912).

**DELAWARE.** A city and the county seat of Delaware Co., Ohio, 24 miles north of Columbus, on the Whetstone (Olentangy) River, and on the Cleveland, Cincinnati, Chicago, and St. Louis, the Pennsylvania Company, and the Hocking Valley railroads (Map, Ohio, E 5). It is the seat of the Ohio Wesleyan University (q.v.) (Methodist Episcopal), opened in 1844, and contains the University and Carnegie libraries and was the birthplace of Rutherford B. Hayes. There are mineral springs noted for medicinal properties. The city is in a rich agricultural and stock-raising region, carries on a considerable trade, and has foundries, railroad repair shops, clay works, and manufactures chairs, carriages, building material, gloves, furs, woollens, lumber, shoes, gasoline engines, cigars,

etc. Delaware, incorporated in 1827, is governed by a mayor, elected every two years, and a municipal council. Pop., 1900, 7940; 1910, 9076; 1914 (U. S. est.), 9500.

**DELAWARE** (from the Delaware River). One of the most important tribes of Algonquian stock, originally occupying what is now New Jersey and the Delaware River basin, eastern Pennsylvania, and southeastern New York. They call themselves *Lenni Lenape*, 'true men,' and claimed and were accorded precedence over nearly all the other tribes of Algonquian kinship. They had a number of subtribes in three principal divisions, of which the Munsee (q.v.) or Wolf tribe differed considerably from the others. They were friendly with the Dutch and Swedish colonists, and in 1682 made the celebrated treaty with William Penn, which was faithfully kept on both sides for over half a century. German Moravian missionaries, among whom were the devoted Zinzendorf, Zeisberger, and Heckewelder, labored among them with great success. Through the aggression of the later settlers, backed by the powerful Iroquois, they were finally compelled to retire to the Susquehanna and upper Ohio region, in consequence of which they became embittered against the English colonists and threw their whole strength with the French side in the French and Indian War of 1754-63. In the Revolution they joined with the British against the Americans and, with other tribes of the Ohio valley, continued the struggle until crushed by Wayne and compelled to accept the Treaty of Greenville, by which, in 1795, the allied tribes ceded nearly all their ancient claims in what is now Pennsylvania and Ohio. During this struggle occurred the massacre of the peaceful Christian Delawares at Gnadenhuetten, Ohio, in consequence of which the remaining converts fled to Canada. By successive removals the larger portion of the tribe drifted from Indiana to Missouri and Kansas, a considerable band settling by Spanish permission in eastern Texas. The main body removed in 1867 from Kansas to the Indian Territory (Oklahoma) and became incorporated with the Cherokee Nation. Of the Delaware there are now but 914 and of the Munsee, 71, residing chiefly in Oklahoma. Consult Harrington, in *American Anthropologist* (1913), and Skinner, *Report Archaeological Survey of New Jersey* (1913).

**DELAWARE BAY.** A bay on the Atlantic coast of the United States, between the States of Delaware and New Jersey (Map: New Jersey, B 5). It receives the Delaware River, whose estuary gradually merges into the bay. It is about 50 miles long to where it contracts to a width of 4 miles. Its greatest width is about 28 miles, and the width at the entrance, between Cape May, in New Jersey, and Cape Henlopen, in Delaware, is about 12 miles. The depth of the channel varies from 30 to 60 feet, but much of the bay has less than 30 feet of water. A breakwater at Cape Henlopen, constructed by the United States government, forms a large and safe harbor from 24 to 35 feet deep. Government lighthouses are maintained at the entrance to the bay and also at a number of places within the bay, not only to mark points on the shore, but also shoal places in the channel. A large tonnage of coast and foreign shipping passes through the bay to and from Wilmington, Chester, and Philadelphia.

**DELAWARE COLLEGE.** An educational

institution founded at Newark, Del., in 1833. In 1859 the college was closed and was not reopened until 1870, when it was made beneficiary of the Congressional Act of 1863 granting public lands to the several States for the purpose of establishing colleges of agriculture and the mechanic arts. Under a further congressional act known as the Hatch Bill, an Agricultural Experiment Station was established at the college in 1887. A second bill, known as the Adams Bill, was passed, and the college derives from these two funds, for experimentation, the annual sum of \$30,000. In 1890 a supplementary bill, known as the Morrill Bill, was passed and in 1897 a bill known as the Nelson Bill, giving the college an annual appropriation of \$40,000. The charter which heretofore had been renewable every 20 years, was at the session of the Legislature in 1913 made permanent; at the same time the State Legislature appropriated \$30,000 annually for five years for the purpose of putting up buildings suitable for opening a college for women in connection with Delaware College, to be opened in September, 1914. It is entirely distinct from Delaware College, having separate classrooms, libraries, and buildings, and is a coordinate college rather than a coeducational one. At the beginning of 1914 the college had property valued at \$400,000 and a total annual income of \$97,480. The library contains 18,000 volumes. The president in 1914 was George A. Harter, M.A., Ph.D.

**DELAWARE RIVER.** A river of the eastern United States. The source of the main, or west, branch, is a small lake in Scholharie Co., N. Y., very near the Delaware County line, on the west slope of the Catskill Mountains, 1886 feet above sea level (Map: New Jersey, C 1). It flows in a southwesterly course to Deposit, a distance of about 100 miles, where it receives the Oquaga Creek, an important tributary, and turns sharply to the southeast and soon forms the boundary between Pennsylvania and New York, receiving at Hancock the waters of the eastern branch, which also rises in the Catskills. At Port Jervis, N. Y., where it becomes the boundary between Pennsylvania and New Jersey, it turns to the southwest and flows 40 miles along the base of the Shawangunk Range to Delaware Water Gap (q.v.), thence generally southward to Easton, Pa., thence southeast to a point just below Trenton, thence southwest again past Philadelphia and Chester, Pa., where it begins to broaden into an estuary, which gradually widens into Delaware Bay. In its lower course it separates New Jersey from Delaware. Its length is about 360 miles to the head of Delaware Bay, or about 410 miles including the bay, and it drains an area of 12,012 square miles, of which one-fourth is in New York, over one-half in Pennsylvania, and about one-fifth in New Jersey. Its mean discharge at Lambertville has been estimated at 18,600 cubic feet per second. It has a considerable fall and furnishes extensive power at Trenton, where it crosses the Fall Line (10 to 15 feet fall), at Lambertville (Welles's Falls, 14 feet), at Belvidere (Foul Rift, 23 feet), and at Port Jervis (30 feet). Its chief tributaries are the Schuylkill (q.v.), the Lehigh (q.v.), and the Lackawaxen, from Pennsylvania, the Monacaup and the Neversink from New York, and the Musconetcong and Maurice from New Jersey. It is navigable for large ships to Philadelphia and for steamboats to the head of tidewater at Trenton. It is sel-

dom that navigation is closed by ice below Philadelphia. A canal parallels the left bank of the river from Easton, Pa., to Morrisville (opposite Trenton), and then cuts across a bend to Bristol. A canal also connects Trenton with New Brunswick (on the Raritan River), and another crosses New Jersey from near Phillipsburg to Jersey City on the Hudson River. A fourth canal parallels the Lehigh River and connects Mauch Chunk with Easton, while a fifth parallels the Lackawaxen River from Honesdale, Pa., to Lackawaxen on the Delaware, and parallels the Delaware to Port Jervis.

**DELAWARE WATER GAP.** A low gap and narrow gorge in the Kittatinny Range of the Appalachian Mountains on the borders of Pennsylvania and New Jersey, near Stroudsburg, Pa. (Map: Pennsylvania, L 5). The Delaware River flows through the gap. The steep mountain sides rise to a height of 1400 feet above the stream, forming very picturesque scenery, which makes the region a popular summer resort. It is reached by rail from Philadelphia (108 miles) and New York (88 miles).

**DE LA WARR, or DELAWARE, THOMAS WEST, LORD (1577-1618).** A Colonial governor of Virginia. He succeeded his father as Baron De la Warr and became a member of Queen Elizabeth's Privy Council in 1602. In 1609 he became a member of the Council of Virginia and in February, 1610, was appointed first Governor and captain-general of Virginia, arriving at Jamestown just in time to prevent the original colonists from abandoning the settlement. Though he lived with ridiculous pomp, he was an able and energetic officer and infused new life into the previously mismanaged colony. He planted a small settlement on the site of the present Hampton and built two forts, Henry and Charles, named in honor of King James's sons. In March, 1611, he sailed for the West Indies for the purpose of recovering his health, but was driven by a storm into the river which now bears his name. He never returned to Jamestown, though he remained the nominal Governor, and contributed large sums of money to the enterprise. In 1618, in answer to the urgent request of the colonists, then smarting under Argall's oppression, he sailed again for America, but died on the voyage. His *The Relation of . . . Lord De la Warr . . . to the Council of Virginia*, originally published in 1611, was republished in 1858. Consult Neill, *The Early Settlement of Virginia* (1878).

**DELBOEUF, dël'beuf, JOSEPH REMI LÉOPOLD (1831-96).** A Belgian philosopher, born in Liège. In 1860 he became an instructor in the normal school of his native town, in 1863-66 was professor of philosophy in Ghent and from 1866 in Liège. He is perhaps best known for his contribution to psychophysics, in his method of mean gradations, whereby he sought to establish an accurate scale of intensities in sensation capable of mathematical expression. His works include: *De la moralité en littérature* (1861); *De la psychologie comme science naturelle, son présent et son avenir* (1875); *Éléments critique de la loi psychophysique* (1883); *Le sommeil et les rêves* (1885); *La matière brute et la matière vivante* (1887). For a criticism of his psychophysical work, consult Bergson, *Time and Free Will* (1910).

**DELBRÜCK, dël'brük, BERTHOLD (1842-).** A German comparative philologist and Sanskrit scholar, born in Putbus. He studied at

the universities of Halle and Berlin and was appointed professor of comparative philology and Sanskrit in Jena in 1869. His works include: *Einleitung in das Sprachstudium* (1880; 4th ed., 1904; Eng. trans., 1882); *Syntaktische Forschungen*, with E. Windisch, vols. i-v (1871-88); and *Vergleichende Syntax der indogermanischen Sprachen*, which forms volumes iii, iv, and v of Brugmann and Delbrück's *Grundriss der indogermanischen Sprachen* (Strassburg, 1897-1913) and *Grundfragen der Sprachforschung* (1901); *Einleitung in das Studium der indogermanischen Sprachen* (1904; 1908); *Synkretismus, ein Beitrag zur germanischen Kasuslehre* (Strassburg, 1907); *Germanische Syntax* (Leipzig, 1909-11); *The Classical Quarterly*, vol. vii, p. 216 (London, 1913).

**DELBRÜCK, HANS (1848-).** A German historian of the art of war. He was born in Bergen, on the island of Rügen, and was educated in Heidelberg, Greifswald, and Bonn. He served as officer in the Franco-German War. In 1874 he became preceptor of Prince Waldemar of Prussia, a brother of Emperor William II, and for a time was Von Ranke's secretary. He was a deputy in the Reichstag in 1882-83 and 1884-90. In 1883 he became an editor of the *Preussische Jahrbücher*, assuming charge in 1899. In 1885 he became professor of modern history at the University of Berlin. His works include: *Die Pensenkriege und die Burgunderkriege* (1887); *Die Strategie des Perikles erläutert durch die Strategie Friedrichs des Grossen* (1890); *Friedrich, Napoleon, Moltke, Aeltere und neuere Strategie* (1892); *Geschichte der Kriegskunst im Rahmen der politischen Geschichte* (3 vols., *Das Altertum*, 1900, *Romer und Germanen*, 1902; *Das Mittelalter*, 1907), his most important work; *Erinnerungen, Aufsätze, und Reden* (1902). *Numbers in History* appeared in 1914. He published an edition of Schulhess's *Europäischer Geschichts-Kalendar*. Consult the introduction to *Delbrück-Festschrift* (Berlin, 1908).

**DELBRÜCK, MARTIN FRIEDRICH RUDOLF VON (1817-1903).** A Prussian statesman, born in Berlin. He came of a distinguished family, his father, Johann Friedrich Gottlieb Delbrück (died, 1830), having been preceptor of the two Prussian princes afterward respectively known as King William IV and Emperor William I. He studied in Halle, Bonn, and Berlin. After an association of 15 years with the Prussian Bureau of Commerce (organized as the Ministry of Commerce in 1848), he became in 1859 Director of the Department of Commerce and Industry, in which capacity he skillfully consolidated the German Zollverein and negotiated important treaties with France (1862) and subsequently with England, Belgium, Italy, and other European states. In August, 1867, through the aid of Bismarck, he was advanced to the presidency of the Chancery of the North-German Confederation. He also became a Prussian minister of state in 1868, and in both positions, in which he was virtually the representative of the "Iron Chancellor," he displayed a strict adherence to constitutional principles, notwithstanding the great difficulties frequently encountered in the defense of the measures advocated by Bismarck. In October, 1870, he was sent on diplomatic missions to the various courts of south Germany, in order to promote the unification of the country, and the ultimate con-

clusion of the treaties at Versailles (Nov. 15, 23, and 25, 1870) was directly due to the skill and tact with which Delbrück had discharged this important mission. He was President of the Imperial Chancellery until 1876, when Bismarck began to inaugurate that programme of protective tariffs and of state railway ownership which Delbrück as the representative of free trade had ever strenuously opposed. His literary productions include the anonymous monograph *Der Zollverein und das Tabaksmopol* (1857) and the legal treatise entitled *Der Artikel 46 der Reichsverfassung*. After vainly endeavoring from 1879 to 1881 to defeat the new policies, he retired to private life. He was honored by the Emperor in 1896 with the Order of the Black Eagle.

**DELBRÜCK, MAX EMIL JULIUS** (1850- ). A German chemist, born in Bergen. He studied chemistry in Berlin and in Greifswald. In 1872 he was made assistant at the Academy of Trades in Berlin and in 1881, after several years of connection with various experiment stations, he was appointed instructor at the Agricultural College (also in Berlin). He was given a professorship in 1899. His researches resulted in technical contributions of the highest value to the fermentation industries. He was one of the editors of the *Zeitschrift für Spiritusindustrie* (1867) and of the *Wochenschrift für Brauerei*.

**DELCASSÉ, dèl'kà'sà', THÉOPHILE** (1852- ). A French statesman, born at Pamiers and educated at Toulouse. He wrote able articles on foreign politics contributed to various journals, notably Gambetta's *La République Française* and *Paris*, and in 1889 was elected to the Chamber of Deputies. He was Undersecretary of State for the Colonies in 1893, and in 1894-95 Colonial Minister in the second Dupuy cabinet. In the Brisson cabinet of June, 1898, he received the portfolio of Foreign Affairs and retained office for seven years. He brought about the alliance with Russia, established relations of amity with Italy, drew into closer touch with Spain, entered into relations of intimate friendship with Great Britain, and negotiated a settlement of the difficulties connected with the French occupation of Fashoda (q.v.). The Agreement with Great Britain of April 8, 1904, embodied a series of mutual concessions. The German government regarded M. Delcassé's policy of alliances as aiming at Germany's isolation in Europe. Confronted by the threat of war over the French policy in Morocco (q.v.), the Premier, M. Rouvier, apparently demanded the resignation of M. Delcassé, June 6, 1905, and took the portfolio of Foreign Affairs himself. In May, 1906, Delcassé was reelected to the Chamber of Deputies. In 1909 he was president of a committee to inquire into naval affairs; the report it made angered Clemenceau into an attack on Delcassé, but the Chamber refused a vote of confidence, and Clemenceau's ministry had to resign. In 1910 Delcassé's elaborate programme for naval improvement was adopted. In March-June, 1911, he was Minister of Marine in Monis's cabinet; and he held this portfolio in the Caillaux and Poincaré ministries of 1911 and 1912; and succeeded De Selves as Minister of Foreign Affairs in January, 1912. In 1913, while still holding his seat in the Chamber, he was in St. Petersburg on a temporary mission as French Ambassador.

**DEL CREDERE** (It., upon faith or credit, from Lat. *credere*, to believe). A phrase of the law merchant, which has been adopted into the commercial codes of Europe as well as into the common-law system of England and America. A *del credere* agent is one who, in consideration of an additional compensation, undertakes to become personally responsible to his principal for the payments and other obligations which accrue to him as the result of his dealings. His undertaking is in the nature of a continuing guarantee that his principal shall suffer no loss through the default of those to whom he has extended credit on the principal's account. The class of agents known as factors are commonly employed on this basis. The agent is said to be acting under a *del credere* commission or authority. See FACTOR; PRINCIPAL AND AGENT.

**DEL'ÈB PALM.** See PALMYRA PALM.

**DELÉCLUZE, de-là-kluz', ETIENNE JEAN** (1781-1863). A French art critic, painter, and novelist. He was born in Paris, studied in the atelier of David, and obtained a gold medal in 1808 with "The Rape of Europa," but after 1810 devoted himself to literature. In his art criticism, contributed to the *Journal des Débats* and other papers and magazines, he championed exclusively the classical style of David and attacked the new Romantic school, especially the painter Delacroix. He wrote: *Précis d'un traité de la peinture* (1828). *Louis David, son école et son temps* (1855). *Souvenirs de soixante années* (1862). Among his romances are *Made-moiselle Justine de Laron* (1832) and others, collected as *Romans, contes et nouvelles* (1843).

**DELECTABLE MOUNTAINS, THE.** The pastures of "the chosen," in *Pilgrim's Progress*.

**DELED'DA, GRAZIA** (1873- ). An Italian novelist, born at Nuoro, Sardinia. Her numerous books reflect realistically the peasant life of Sardinia, of which she is the best modern interpreter. She is inclined to depict characters of virtue and idealism in tragic conflict with sad conditions of life. Typical works are: *Racconti sardi*; *Il vecchio della montagna*; *Canne al vento*, trans. of *Dopo il divorzio* (London, 1905). Consult the *Fortnightly Review*, vols. lxxxi, lxxxiii, lxxxiv.

**DELEGATE, APOSTOLIC.** See LEGATE.

**DELEGATES, HIGH COURT OF.** In England, the supreme court of appeal in ecclesiastical causes. Before the time of Henry VIII the practice had become established of taking ecclesiastical causes on appeal from the "ordinary," or bishops, courts to the court of Rome. By 24 Hen. VIII, c. 12, this practice was prohibited, and appeals were directed to be heard by the archbishops of the several provinces. By 25 Hen. VIII, c. 19, it was directed that appeals should finally be referred to the King in council, and his Majesty was by the same statement empowered to issue a commission under the great seal to hear the appeals. The court established in pursuance of this act was known as the High Court of Delegates. It consisted, in ordinary causes, of a puisne judge from each of the three superior courts of common law (King's Bench, Common Pleas, and Exchequer) and of three or more doctors of the civil law. After sentence had been pronounced by the court of delegates it was competent for the King to grant a commission of review, but this power was rarely exercised. By 2 and 3 Wm. IV, c. 92, the court of delegates was abolished, and its jurisdiction

transferred to the King in council, and by 3 and 4 Wm. IV, c. 41, and 6 and 7 Vict., c. 38, all appeals from ecclesiastical courts go to the judicial committee of the Privy Council. See ADMIRALTY; ECCLESIASTICAL COURTS; PRIVY COUNCIL.

**DELEGATION** (Fr. *délégation*, Lat. *delegatio*, from *de*, away, from *legare*, to send with a commission). The term formerly applied in Lombardy, Venetia, and the Papal States, both to the governing court of a province and to the province itself. There were nine delegations in Lombardy and eight in Venetia, each of which was presided over by a delegate, a vice delegate, and various subordinates. In the States of the Church there were 17 delegations originally established, but this number was not strictly adhered to. The delegate was always a prelate and directly appointed by the Pope. If he was a cardinal, he was called a legate, and his province a legation. In Austria-Hungary the Austrian and Hungarian delegations constitute the deliberative assembly for the dual monarchy. See AUSTRIA-HUNGARY.

**DELEHAYE**, dè'le-à', HIPPOLYTE (1859- ). A Belgian Catholic scholar, born in Antwerp. He entered the Society of Jesus in 1876, studied at Louvain and Innsbruck, was ordained a priest in 1890, and in 1891 became a member of the association of Bollandists. He was one of the editors of the *Acta Sanctorum* and of the *Analecta Bollandiana* and wrote important separate volumes on hagiology. Mrs. V. M. Crawford published (1907) an English version of one of his works under the title *Legends of the Saints: an Introduction to Hagiography*.

**DE LEON**, EDWIN (1828-91). An American journalist, diplomatist, and author, born in Columbia, S. C. In 1862 he became diplomatic agent in Europe during the Civil War and afterward Consul General of the United States at Cairo. He wrote: *Thirty Years of my Life on Three Continents*; *The Khedive's Egypt* (1878); *Askaros Kassis, the Copt* (1870); and *Under the Stars and Under the Crescent* (1887).—His younger brother, THOMAS COOPER DE LEON (1839- ), also born in Columbia, is the author of *Creole and Puritan* (1889); *The Puritan's Daughter* (1891); *Four Years in Rebel Capitals* (1892), historical reminiscences, *The Rending of the Solid South* (1895); *Crag-Nest* (1910).

**DELEPIERRE**, dèl'pè-à', JOSEPH OCTAVE (1802-79). A Belgian author. He was born in Bruges and studied in Ghent. In 1849 he was appointed Belgian Consul to London and filled that position until 1877. Besides editions of older works, such as *Aventures de Tiel Ulenspiegel* (2d ed., 1840) and *Macaroniana* (1852), he published: *Les traditions et légendes des Flamands* (1834); *Histoire littéraire des fous* (1860); *La parodie* (1871); *Tableau de la littérature du centon* (2 vols., 1875); *L'Enfer: Essai philosophique et historique* (1876).

**DELESCLUZE**, de-la kluz', LOUIS CHARLES (1809-71). A French politician and journalist, who took a prominent part in revolutionary conspiracies in the time of Louis Philippe, of the Republic of 1848, of the Second Empire, and the Third Republic. He was many times imprisoned and in 1857 was deported to Cayenne, whence he returned in 1859 under the amnesty. In 1868 he started the *Réveil*, a most radical paper, advocating the ideas of the Association inter-

*nationale des travailleurs*, known as the *Internationale*. After the collapse of the Empire he organized the revolt against the Government of National Defense, and for this was arrested, but was soon released. Elected to the National Assembly (1871), he resigned from that body on being chosen a member of the Commune, of which he was a conspicuously desperate and reckless leader during the seige of Paris. Seeing the collapse of the Commune, he sought and found death on the last barricade held by the revolutionists in the Rue d'Angoulême. His sufferings while a prisoner he has described in *De Paris à Cayenne, journal d'un transporté* (1869).

**DE LESSEPS**. See LESSEPS.

**DELFT** (Dutch, ditched; connected with AS. *delf*, ditch, from *delfan*, Dutch *delfen*, to dig, OHG. *bi-telban*, to bury, Eng. *delve*). A quaint old town of the Netherlands, situated on the Schie, about 6 miles southeast of The Hague and 8 miles northwest of Rotterdam (Map: Netherlands, C 2). It is intersected by many canals lined with trees and contains a number of interesting buildings. In the Prinsenhof, now converted into a museum with many fine paintings, William I of Orange was assassinated on July 10, 1584. The Oude Kerk, a Gothic structure, dating from the fifteenth century, contains monuments of famous Dutchmen, including one of Admiral Tromp, and the Gothic Nieuwe Kerk, dating from the fourteenth century, is surmounted by a tower 375 feet high, containing a famous set of chimes. The church contains the family vault of the house of Nassau, the mausoleum of William I, and the remains of Hugo Grotius, the statesman and scholar, a native of Delft, who has also been commemorated by a bronze statue. The town hall dates from 1618 and contains interesting paintings. The town's educational institutions include a polytechnical school, with over 1100 students, and a training school for colonial officials; it also has a powder magazine and arsenal. In former times Delft was especially famous for its earthenware, known as Delftware, and made in imitation of Chinese and Japanese porcelains. This industry, after a period of complete decline, has been revived of late. There are also arms and ammunition factories, and other manufactures comprise carpets, cloths, cigars, soap, oil, mathematical instruments, and leather. The town was founded in the eleventh century, received a charter in 1246, and was almost destroyed in 1536 by a fire and in 1654 by the explosion of a powder magazine. Pop., 1900, 31,582; 1910, 34,485.

**DELFTSHAVEN**, delfts'hà'ven. An old town on the river Meuse, in South Holland, since 1886 a suburb of Rotterdam (q.v.). The Pilgrim Fathers embarked at Delftshaven for Southampton, July 22, 1620.

**DELGADA**, dèl-gà'dà. See PONTA DELGADA.

**DELHI**, dèl'è. The name of a former division of the Punjab, British India (Map: India, C 3). Out of the Delhi division was erected, Oct. 1, 1912, the new Province of Delhi, and the remainder took the name of Ambala division. Ambala is the southeastern division of the Punjab, being separated from Agra on the east by the Jumna River; it lies entirely in the plains, with the exception of the small district of Simla and the hill station of Kasauli. The area is 14,838 square miles, and the population (1911 census) 3,784,408. The detached Province of

Delhi has 557 square miles, with 391,828 inhabitants. The Delhi division therefore had an area of 15,395 square miles and a population of 4,176,236 against 4,587,150 in 1901 and 4,434,751 in 1891. In 1901 about 71 per cent of the population was Hindu and about 26 per cent Mohammedan; Christians numbered 12,108, of whom less than 4000 were natives. The division is mainly agricultural and comprises 7 districts. The capital is Ambala (pop., 1911, 80,131). Other towns of importance are Bhiwani, Rewari, Panipat, Karnal, Rohtak, and Simla.

**DELHI.** The smallest province of British India. It was constituted, Oct. 1, 1912, as a result of the removal of the seat of the Indian government from Calcutta to the city of Delhi. The province, which is administered by a chief commissioner, consists of the city of Delhi and outlying districts with an aggregate area of 557 square miles, detached from the old Delhi division of the Punjab. Pop., 1911, 391,828.

**DELHI**, also **DEHLI** or **DILLI**. The former capital of the Mogul Empire, now the capital of Delhi Province and of British India (Map: India, C 3). It is situated on the west bank of the Jumna River, in lat 28° 39' N. and long. 77° 15' E., distant by rail 956 miles from Calcutta, 982 miles from Bombay, and 907 miles from Karachi. The city, which extends over 2 miles along the river, is inclosed on three sides by a stone wall  $3\frac{1}{4}$  miles long: it was built by Shah Jehan and reconstructed, early in the nineteenth century, by the British. In the eastern part of the city and directly on the river lies the old Mogul palace, inclosed on three sides by a wall of red sandstone; it is now called the Fort. To the northeast is the Salimgahr outwork, where the East Indian Railway enters the city by a fine bridge across the Jumna. To the northwest of the Fort is an open space containing official buildings and the Protestant church of St James. South of this space and of the railway are the public gardens. The cantonment is in the southeast part of the city. The territory comprising these sections, and constituting nearly half the city, contrasts sharply with the native, or southwestern, portion, whose streets for the most part are narrow, crooked, and densely populated. The native part of Delhi, though largely a mass of mean houses, is interspersed with splendid mosques.

Delhi was rebuilt on its present site by Shah Jehan (whence it is called Shahjehanabad) at a time when the glory of Mogul architecture was at its zenith. It was Shah Jehan who built that pearl of all architecture, the Taj Mahal, at Agra, and it was he who built the splendid Imperial palace, or group, at Delhi (1638-48). This palace, or group walled on three sides, is an oblong, 3202 feet north and south (along the river), and 1600 feet east and west. It now contains the ugly British barracks, and much of its former splendor has been lost. Entrance is through a magnificent portal to a vaulted hall, 375 feet long, facing which is the music hall; beyond is the great court, in which stands the hall of public audience; and beyond this is the painted chamber. It was in the hall of public audience that the peacock throne, which bore a fully expanded peacock's tail done in gems, used to stand, in a recess of the back wall; it is estimated that the throne was worth some £6,000,000. The buildings just mentioned constitute a central range, north of

it is the private audience hall. The latter, which is close to the river, has been called the most ornamented of all Shah Jehan's buildings. It abounds with delicate inlaid work and bears the inscription, in Persian characters, "If there is a heaven on earth, it is this—it is this!" The harem and private apartments of the palace lay south of the central range, covering a space about 1000 feet square.

Near the Chandni Chauk (Silver Street) is the Jama Masjid (Great Mosque), begun by Shah Jehan in the fourth year of his reign and finished six years later: it is one of the most noteworthy buildings of its kind in India on account of both its dimensions and its architecture. It stands on elevated ground, so that its front courtyard, which is 450 feet square and surrounded by a fine open cloister, commands a view of the city. The mosque, 261 feet long, has two graceful minarets at the front corners and three white marble domes; white marble also forms the interior paving as well as the lining of walls and roof. Mention should be made also of the Kali Masjid (Black Mosque), built, it is supposed, by an early Afghan ruler, the small Moti Masjid (Pearl Mosque), built by Aurangzeb, and the mosque of Roshan-ud-daula.

The principal street of Delhi is the Chandni Chauk,  $\frac{3}{4}$  mile long and 74 feet wide. This street is lined with warehouses and with shops (notably those of dealers in gold and silver embroidery). Among its buildings of special note are the high clock tower and the city hall; the latter has a picture gallery, a public library, and a museum. The old palaces of the nobles have in large part disappeared. Beyond the city walls is a considerable population which is included in the municipality. Outside of the walls also are the Imperial tombs. The tomb of Humayun is about  $3\frac{1}{2}$  miles from the Delhi Gate (south wall). It is an imposing square building of pink sandstone, surmounted by a white marble dome: it stands on a platform, 200 feet square, supported by cloisters, which is surrounded by a terraced garden and this by a battlemented wall. About a mile to the west are the tombs of the Imperial Mogul family, each inclosed by latticework of white marble. Here, too, are numerous small mosques, notably the one in memory of the saint Nizam-ud-din.

The Delhi College, founded in 1792, was the principal educational institution until 1877, when, in order to concentrate higher education, its endowment was transferred to the Punjab University at Lahore. The principal school now is the municipal high school (which occupies the old Residency), with six branch schools; there are several other high schools, a municipal industrial school, a normal school for vernacular teachers, and other educational establishments.

The industries of Delhi include the making of jewelry (for which the city has long been famous), gold and silver embroidery, articles of silver, brass, and copper ware, etc. In recent years western manufacturing has made considerable progress; there are cotton mills, flour mills, sugar mills, etc. The city carries on an extensive trade, especially in piece goods and grain. The municipality was created in 1850. Delhi has a drainage system, a good lighting system, and an ample water supply; of late its sanitary conditions have greatly improved. Pop., 1891, 192,579; 1901, 208,575; 1911, 232,837 (the increase being 11.6 per cent). In 1901

about 55 per cent of the inhabitants were Hindus and about 42 per cent Mohammedans; Christians numbered 2164.

The city of Indraprastha (ancient Delhi), unrivaled in its splendor among the cities of India, was situated on the opposite bank of the river. Its original foundations are supposed to date from the fifteenth century B.C. Its remains cover an area of about 30 miles in circumference. The authentic history of Delhi begins in 1193, when the city was taken by the Mohammedans. Thereafter under the first dynasties of its Afghan conquerors it was the centre of a mighty Mohammedan empire, reaching its highest power in the early fourteenth century. Although captured and sacked by Timur in 1398, Delhi remained under its Afghan emperors until 1526, when it was taken by Sultan Baber, who removed the capital to Agra, but under his son Delhi regained its former rank. In the latter part of the sixteenth century the city fell almost into utter decay, as the capital of the state was either at Agra or Lahore. Shah Jehan began the building of the modern city in 1638, and some of the finest edifices of Delhi belong to that period. At the beginning of the eighteenth century the decline of the Mogul Empire affected also the city of Delhi. In 1739 it was captured by the Persians, and, as a result of an attack by the natives on the invading army, many of the inhabitants were massacred and the city was despoiled of some of its finest treasures, including the peacock throne and the Koh-i-Nur diamond. In 1789 Delhi was captured by the Maharrattas, in whose possession it remained until 1803, when it was taken by Lord Lake, and has since remained in the possession of the British. The uprising of 1857 and the subsequent siege of the city form some of the most stirring events in the history of the British occupation of India. The invasion of the city by a handful of rebels from the cantonment of Meerut on May 10, 1857, was a signal for a general uprising in the city, as well as in northwestern India, and the rebels were soon joined by the native troops. The Europeans were mercilessly cut down, and the large powder magazine was exploded by the British officers, who were unable to defend it against the attacks of the natives. Europeans and friendly native troops began to arrive at the beginning of June, but it was not before September that the army of relief was strong enough for an assault on the city. On September 14 Delhi was entered by the British, but it was only after six days' fighting within the walls that the city was retaken. The British losses during the siege amounted to over 1000 killed and nearly 4000 wounded. The old Bahadur Shah, who was proclaimed Emperor by the mutineers, was exiled to Rangoon, and his death in 1862 marked the end of the Mogul dynasty. The city subsequently settled down into a prosperous railway and commercial centre. Because of its Imperial traditions, however, Delhi was selected as the scene of the Imperial Proclamation of Jan. 1, 1877, and of the Durbar in 1903, at which King Edward VII was proclaimed Emperor of India. The growing native unrest led King George V and his consort to visit India for their Imperial coronation. At the brilliant Durbar held at Delhi on Dec. 12, 1911, unexpected changes were announced for the administration of India, involving the transference of the capital from Calcutta to Delhi. On Oct. 1, 1912, the Punjab division of Delhi was recon-

stituted as a new province. In 1913 Imperial and native endowments were announced for making Delhi the educational as well as the political centre of India.

Consult: Brown, *The Punjab and Delhi in 1857* (London, 1861); Chambers, *History of the Indian Revolt* (Edinburgh, 1859); Fanshawe, *Delhi, Past and Present* (London, 1902); Wheeler, *History of the Delhi Coronation Durbar* (ib., 1904); Festing, *When Kings Rode to Delhi* (ib., 1912).

**DELHI**, dĕl'hi. A town and the county seat of Delaware Co., N. Y., 66 miles (direct) west by south of Albany, on the Delaware River, and on the New York, Ontario, and Western Railroad (Map: New York, F 6). It is the seat of a State agricultural school and has silk mills and creameries. The water works are owned by the town. Pop., 1910, 1736.

**DELIA**. See DELOS; GREEK FESTIVALS.

**DELIAN LEAGUE**. See DELOS; GREECE, *History* (Ancient History).

**DELIAN PROBLEM**. See CUBE.

**DELIBES**, de-lĕb', CLÉMENT PHILIBERT LÉO (1836-91). A French composer, born at Saint-Germain du Val, Sarthe. He studied at the Paris Conservatory, where he won many prizes, and in 1853 became accompanist at the Théâtre Lyrique and organist at Saint-Jean et Saint-François. In 1865 he became second chorus master at the Opéra and in 1880 was made professor of composition in the Conservatory. In 1884 he became a member of the Institute, succeeding Victor Massé. Delibes became popular with his first operetta, *Deux sacs de charbon* (1855), and then wrote a number of comic operas and ballets, of which the most famous are: *Le roi l'a dit* (1873) and *Lakmé* (1883), operas; *Coppélia* (1870) and *Sylvia* (1876), ballets. They are famous for delicacy and brilliant, fairy-like orchestral effects. Consult A. Pougin, *Musiciens du XIXe siècle* (Paris, 1911).

**DELIGHT OF MANKIND'** (Lat. *amor ac deliciae generis humani*). A title given to the Roman Emperor Titus, in admiration of his mildness and virtues. Consult Suetonius, *Titus*, i.

**DELI/LAH** (Heb., delicate). The name of a Philistine woman whom Samson loved. Her home was in the valley of Sorek. By her flattering blandishments she obtained from him the secret that his great strength lay in his locks, and, having cut these off while he lay asleep, she then treacherously betrayed the warrior, shorn of his strength, into the hands of his enemies (Judg. xvi. 4-31). See SAMSON.

**DELILLE**, de-lĕl', JACQUES (1738-1813). A French didactic poet and translator, born at Aigueperse, June 22, 1738. He achieved extraordinary popularity in the eighteenth century, but is now hardly read or thought readable. He mistook his prolix habit of paraphrasing for poetical expression; he would enumerate various characteristics and leave it to the reader's imagination to supply the name of the object described. His translation of Vergil's *Georgics* (1769) was esteemed at least equal to the original, and *Les jardins ou l'art d'embellir les paysages* (1782; enlarged ed., 1801) was deemed immortal. After the outbreak of the Revolution he followed the Emigration. He lived for a time in Switzerland, where he published *L'Homme des champs, ou les Géorgiques françaises* (1800). In 1801 he went to England, where he translated *Paradise Lost*. That same

year he returned to his seat in the Academy and his professorship of Latin and belles-lettres in the University of Paris and the Collège de France, which he held till blindness intervened. This, however, did not check the stream of his poetic production, which in these last years included *La pitié*, in four cantos (1803); Vergil's *Enéide* (1805); *L'Imagination*, in eight cantos (1806); *Les trois règnes de la nature* (1809); *La conversation* (1812). He died in Paris, May 1, 1813. Consult *Sainte-Beuve, Portraits littéraires*, vol. ii (Paris, 1864), and L. Audiat, *Un poète oublié: J. Delille* (ib., 1902).

**DELIRIQUESCENCE** (Lat. *delirescere*, to melt away, dissolve, from *de*, down, away + *liquere*, to be fluid, liquid). The term applied to the property which certain substances have of absorbing moisture from the air and becoming damp and even running into liquid. The substances possessing this property are said to be deliquescent. Caustic potash and the chlorides of calcium and magnesium are examples of deliquescent substances.

**DELIRIUM** (Lat., literally, being off the straight line, or furrow, from *de*, off, away + *lira*, furrow). A derangement of mind during illness, in which the intellect and the judgment are perverted or lost, while the imagination and the passions are often excited or at least left without control. The result is an incoherent or totally disordered course of action and speech, frequently attended by delusions or unreasonable beliefs, which the sound mind at once perceives to have no foundation in fact. Two types of delirium are recognized: *active* or *loud delirium*, in which the sufferer shouts, struggles, tries to escape from imaginary enemies and has to be forcibly restrained; *low* or *muttering delirium*, in which the patient lies still, but is constantly engaged in incoherent and disjointed converse with himself or imaginary persons. Active delirium is the form most frequently observed in delirium tremens. Muttering delirium is characteristic of the later stages of typhoid fever. Delirium may occur during the invasion of pneumonia scarlet fever, smallpox, bubonic plague, or during uræmia, chorea, hysteria, epilepsy, etc. *Delirium tremens* (Lat., shaking delirium) is the result of long-continued alcoholic intoxication and may attack a "moderate drinker" during a single excessive indulgence. Delirium tremens is characterized by a restless, irritable state of the nervous system rather than by furious paroxysms of excitement (though these are not rare), by constant though ill-regulated and ineffectual attempts of the patient to occupy himself; by spectral illusions of horrible, terrifying, or very rarely amusing objects, such as animals, snakes, goblins, etc., or hallucinations of vision and hearing; by tremors of the hands and tongue; by loss of appetite, nausea, and vomiting; and by great wakefulness, the want of sleep being often protracted over many days and nights, with constant excitement of the senses, and the prostration of the vital powers from deficient nourishment. In treating delirium tremens bromides, chloral, rarely opium, strychnine, and other powerful drugs are used, with purgatives. Stimulants other than alcohol are frequently needed. The condition is very dangerous, as about 17 per cent of the patients die; and the use of drugs, of restraint when the patients are furious, and the direction of nourishment must be under the

administration of a physician. See **ALCOHOL; MANIA**.

**DELIRIUM EBRIOSUM** (Lat. *ebriosus* addicted to drink, from *ebrius*, drunk). An obsolete term, used to denote either the delirium accompanying acute alcoholism or, delirium tremens. In the former there are exaltation, garrulity, boastfulness, delusions of a grandiose character, followed by violent verbal abuse, passion, and often fierce anger without cause, which prompts the inebriated individual to break furniture, glassware, panes of glass in windows, etc. Delirium tremens is described under **DELIRIUM** (q.v.).

**DELIRIUM NERVOSUM**, or **TRAUMATICUM** (Lat. *neruosus*, nervous; *traumaticus*, from Gk. *τραυματικός*, *traumatikos*, of wounds, from *τραύμα*, *trauma*, wound). A term employed by Dupuytren to designate an attack of delirium with tremors, which frequently supervenes on severe bodily injuries, such as gunshot wounds, burns, and fractures—chiefly met with in large hospitals—in the case of persons of weakly constitution, and who are irritable and nervous and have been intemperate in their habits. Delirium nervosum is an obsolescent term. It is really a form of delirium tremens, manifesting itself in alcoholics with pneumonia, or after operations or injuries, and is the forerunner of death in some operative cases.

**DELIRIUM TREMENS**. See **DELIRIUM**.  
**DELISLE**, de l'É. See **LISLE**, **GUILAUME DE**.  
**DELISLE**, LÉOPOLD VICTOR (1826-1910). A French historian and bibliographer, born at Valognes. For many years he was connected with the Bibliothèque Nationale. In 1871 he was made director of the department of manuscripts and in 1874 general director of the great library. His works include: *Rouleau des morts du XIème au XVIème siècle* (1866); *Le cabinet des manuscrits de la Bibliothèque Nationale* (3 vols., 1868-81); *Inventaire général et méthodique des manuscrits français* (2 vols., 1876-78); *Les Bibles de Gutenberg* (1894); *Catalogue des livres imprimés ou publiés à Caen avant le milieu du XVIème siècle* (2 vols., 1903-04); *Les heures de Blanche de France* (1905); *Recherches sur la librairie de Charles V* (1907); *Les heures dites de Jean Pucelle* (1910); *Instructions élémentaires et techniques pour la mise et le maintien en ordre des livres d'une bibliothèque* (4th ed., 1910). For a fuller list of his early works, consult Oursel, *Nouvelle biographie normande* (Paris, 1885).

**DELITZSCH**, dā'lich. A town and important railway junction of the Prussian Province of Saxony, 15 miles north of Leipzig on the right bank of the Lohr (Map: German Empire, E 3). It is an old but well-built town, still partially surrounded by walls. The castle of the fourteenth century, rebuilt in 1690, is now used as a female penitentiary. The manufactures include cigars, beer, cereals, sugar, sirup, shoes, and hosiery. In the neighborhood are rich coal mines. The town is the birthplace of the famous naturalist Christian Gottfried Ehrenberg and the economist Schulze-Delitzsch. Pop., 1900, 10,500; 1905, 10,940; 1910, 13,031. Delitzsch was incorporated with Prussia in 1815. Consult Lehman, *Chronik der Stadt Delitzsch* (Delitzsch, 1852).

**DELITZSCH**. See **SCHULZE-DELITZSCH**.  
**DELITZSCH**, FRANZ (1813-90). A German Lutheran theologian, born and educated in Leip-

zig. He became professor of theology at Rostock in 1846, at Erlangen in 1850, and at Leipzig in 1867. He was one of the strongest exponents of what is called the Erlangen school, or the strictest orthodox theology. He interested himself in the conversion of the Jews—he was of Hebrew descent—and for this purpose used his great knowledge of Hebrew and the Talmud and founded a training school (1886), now called the Institutum Delitzschianum. His translation of the New Testament into Hebrew (1877) was widely circulated in Galatia and Russia. His earlier works were intensely conservative and strictly Lutheran, but later he approached the position of the radical higher critics. He aided Baer in editing the Massoretic text of the Old Testament (1869-95). Besides commentaries on *Habakkuk* (1843), *Genesis* (1852; 1887; English, 1888), *Psalms* (1858-60; English, 1873), *Job* (1864; English, 1866), *Isaiah* (English, 1875), *Proverbs* (1873; English, 1874-75), *The Epistle to the Hebrews* (1857; English, 1865), *Song of Songs and Ecclesiastes* (English, 1877)—the English versions being in "Clark's Foreign Theological Library"—and other theological works, he published some popular devotional writings, among which the following had a wide circulation: *Das Sakrament des wahren Leibes und Blutes Jesu Christi* (1844); *Vier Bücher von der Kirche* (1847); *Philemon, oder von der christlichen Freundschaft* (2d ed., 1858); *Handwerkerleben zur Zeit Jesu* (1868; Eng. trans., 1877; 1902); *Ein Tag in Kapernaum* (1871); *Durch Krankheit zur Genesung* (1873). Consult Curtiss, *F. Delitzsch* (London, 1891).

**DELITZSCH, FRIEDRICH** (1850- ). A German Assyriologist, a son of Franz Delitzsch. He was appointed extraordinary professor at Leipzig in 1877, ordinary professor at Breslau in 1893, and in 1899 professor of Assyriology in the University of Berlin. His lectures attained a wide popularity, and one of them, entitled *Der babylonische Ursprung hebraischer Ideen*, delivered in 1901, was attended by Emperor William II, who also gave a large sum towards the researches to be made in the territory of ancient Babylonia. In 1906 he lectured in the United States. He wrote: *Assyrische Lesestücke* (4th ed., 1900); *Wo lag das Paradies?* (1881); *Studien über indogermanische Wurzelverwandtschaft* (2d ed., 1884); *Assyrisches Wörterbuch zur gesamten bisher veröffentlichten Keilschriftliteratur* (1887 et seq.); *Assyrische Grammatik* (1889); *Assyrisches Handwörterbuch* (4 vols., 1894-96); *Das babylonische Welterschöpfungsepos* (1896); *Babel und Bibel* (1902; Eng. trans., 1903); *Assyrien und die Assyrische Kultur seiner Zeit* (1909); *Handel und Wandel in Altbabylonien* (1910); numerous articles in *Mitteilungen der Deutschen Orient-Gesellschaft* (1899-1913); *Kleine sumerische Sprachlehre* (1914); *Sumerisches Glossar* (1914).

**DELIUS** (Lat., from Gk. Δελίος, *Delios*). A name given to Apollo, who was fabled to have been born on the island of Delos.

**DELIUS, FREDERICK** (1863- ). An English composer. He was born in Bradford, Yorkshire, of German parents. In 1883 he went to Florida as manager of an orange plantation, and there he began the study of composition by himself. From 1886 to 1888 he studied at the Leipzig Conservatory under Reinecke and Jadassohn. In 1890 he took up his residence in

Paris. His compositions show decided talent and originality and have been received with marked favor. His works include the operas *Koanga* (1904), *Romeo and Juliet in the Village* (1907), *Margot la Rouge* and *Fennimore* (1914); for orchestra, an overture *Over the Hills, a Norwegian Suite, Paris, Lebenstanz, a Legend* for violin and orchestra, a piano concerto in C m.; and the choral works with orchestra *Appalachia, Sea-Drift, A Mass of Life*. Consult M. Chop, "Frederick Delius" in vol. ii, *Monographien Moderner Musiker* (Leipzig, 1907).

**DELIUS, Δελίος, NIKOLAUS** (1813-88). A German philologist and Shakespearean scholar, born in Bremen. He studied at the universities of Bonn and Berlin, visited England and France, and settled in 1841 in Berlin. In 1846 he removed to Bonn, where he was professor from 1855 to 1880. Among his writings those concerned with the criticism and interpretation of Shakespeare's works are the most important, above all, the great edition of the complete works, with a critical preface and explanatory notes, published 1854-61, and repeatedly thereafter. Besides this must be mentioned *Die Tiesche Shakespeare-Kritik* (1846); *Der Mythos von William Shakespeare* (1851); *Ueber das englische Theaterwesen zu Shakespeares Zeit* (1853); *Shakespeare-Lexikon* (1851); *Pseudo-Shakespearsche Dramen* (1856-74).

**DELIVERY** (OF. *delivrer*, Lat. *deliberare*, to free, from *de* + *liber*, free). The physical transfer of possession. The term is commonly employed in the law to characterize such an act when performed with the purpose of creating or transferring a legal right. Its significance springs from the importance of physical possession as an element of ownership. In primitive society it is the principal, and in its earlier stages the controlling, element in the conception of property. The metaphysical notion of ownership, dis severed from possession and even from the right of possession, belongs to a comparatively advanced stage in the evolution of legal ideas. At first possession, if not theoretically identical with ownership, is at least attended with its legal effects and always tends in practice to supersede the more abstract right, a fact which finds expression in the maxims *boni possidentes*, "Possession is nine points of the law," etc. Under such a conception of ownership there is only one way in which the title to property can be transferred, and that is by the actual transfer of the physical control over the property, and hence delivery of possession becomes the important fact in the assignment of legal rights over physical objects.

It is easy to see how this simple process, so convenient and appropriate in the case of chattels, came to be transferred to the conveyance of interests in lands. There was no way in which these interests, however temporary and limited in character, could be vested in another but by putting him into possession of the land itself, and thus we find the early method of conveying to be the transfer of the land by delivery. See **FEOFFMENT**; **LIVERY OF SEISIN**; **SEISIN**.

Though this method of conveying real property has been superseded on both sides of the Atlantic by more convenient methods, the notion of the significance of delivery has been transferred to the written instrument by which lands

are now universally conveyed, and has even been extended to other transactions in which similar instruments are employed; while in the case of chattels delivery of possession is still the usual, and in many cases the essential, mode of transfer. See **DEED**; **GIFT**; **SALE**.

While delivery usually contemplates the actual handing over of the subject matter of the transaction by the transferor, or party to be bound, to the transferee, or party to be benefited, it may equally be effected by any appropriate and manifest act whereby the deliverer is put in the same position of control over the thing as that which the deliveror held prior to the act. The possession thus assumed may be immediate and personal or it may be by an agent or servant. The transfer of title to a house may, if so intended, carry with it the possession of the chattels therein, and the actual physical delivery of a key may constitute a delivery of securities in a strong box or of a horse in a stable. So there may be a symbolical delivery, as of goods, by the transfer of the bill of lading or warehouse receipt describing them, or of money on deposit in a savings bank, by passing over the bank book. There is also what is called a "constructive" delivery, as where a part of a bill of goods is delivered for the whole, or where, a thing having been placed by the owner in the custody of a third person, the custodian agrees to hold it for the deliverer.

It will be noticed, however, that in no case is there a legal delivery by mere words indicating an intention to transfer the title, without some overt and significant act on the part of the donor or vendor, whereby he surrenders his control over the article. The nearest approach to such a case is that referred to in the article on **DEED**, where such a declaration of intention accompanies and explains an equivocal act, such as the laying down of an instrument on the desk of the deliveror or his inclosing it in an envelope addressed to the deliverer. See **POSSESSION**.

Consult Pollock and Wright, *An Essay on Possession in the Common Law* (Oxford, 1888), and the authorities referred to under such titles as **SALE**; **POSSESSION**; **TITLE**; **ETC.**

**DELIVERY.** See **OBSTETRICS**.

**DELLA CRUSCAN SCHOOL.** About the year 1785 a number of English residents in Florence sought to beguile their leisure hours by writing verses, which they published under the title of *The Florence Miscellany*. The insipidity, affectation, and fantastic silliness of these productions transcended belief; yet, such was the poetic destitution of the period that they soon found admirers and imitators. Taking the name of an academy in Florence (see **ACADEMY**), the Della Cruscans presently began to print their lucubrations in England, chiefly in two daily newspapers called the *World* and the *Oracle*. "While the epidemic malady was spreading from fool to fool," says Gifford puntingly, "one of the brotherhood, a Mr. Robert Merry, came over from Florence and immediately announced himself by a sonnet to Love." It was answered by a certain Anna Matilda, who (as was the custom) praised it immoderately in language even more absurd than Merry's own. "The fever now turned to a frenzy," Gifford continues; Laura, Maria, Carlos, Orlando, Adelaide, and a thousand other nameless names caught the infection; and from one end of the kingdom

to the other all was nonsense and Della Crusca." Retribution came, however, for in 1794 Gifford produced his *Baviad* and in 1796 his *Merviad*. Rarely has literature witnessed such an exorciation. It quickly and completely killed the "school," and, indeed, it is only in these two poems that the memory of most of the unhappy Della Cruscan songsters has been preserved at all.

**DELLA ROBBIA.** See **ROBBIA**.

**DELLENBAUGH,** dél'en-bə, **FREDERICK SAMUEL** (1853- ). An American explorer, born at McConnelsville, Ohio. He was educated in Buffalo, New York City, Munich, and Paris. In 1871-73 he was artist and assistant topographer with Major Powell's second expedition down the Colorado River, and in 1899 he was a member of the Harriman expedition to Alaska and Siberia. He served as librarian of the American Geographical Society from 1909 to 1911 and became a fellow of the American Ethnological Society. Besides contributions to Sturgis's *Dictionary of Architecture*, to the second edition (1914-15) of the *NEW INTERNATIONAL ENCYCLOPEDIA*, and to magazines, his writings include: *The North Americans of Yesterday* (1900); *The Romance of the Colorado River* (1902; 3d ed., 1909); *Breaking the Wilderness* (1905); *A Canyon Voyage* (1908); *Frémont and '49* (1913; 2d ed., 1914).

**DELLYS,** dél-léz' (Kabyle *Teddes*, Lat. *Rusucurru*). A seaport town and important military post of Algeria, situated 40 miles east of Algiers, with which it is connected by rail. It is divided into a European and a native port and has a good roadstead. It contains a mosque and an industrial school and carries on a considerable trade in grain, olives, and wine. Pop. (commune), 1901, 13,977; 1911, 13,020, including 960 French residents. The city has been successively Roman, Arab, Spanish, and Turkish, and is now under French control.

**DEL MAR, ALEXANDER** (1836- ). An American economist, born in New York City and educated at New York University. He founded the *Social Science Review* and was its editor in 1864 to 1866, and in the latter year organized and was director of the United States Bureau of Statistics. In 1876 he was appointed mining commissioner of the United States Monetary Commission. His publications comprise: *The National Banking System* (1865); *The History of Precious Metals* (1880); *The History of Money in Ancient Countries* (1884); *The Science of Money* (1885); *Money and Civilization* (1886); *The History of Money in America* (1899); *Ancient Britain* (1900); *Worship of Augustus Caesar* (1900); *Middle Ages Revisited* (1900); *History of Money in the Netherlands* (1903); *Messiah, a History of the Colonization of Asia Minor, Egypt, and Europe from the Orient* (1907).

**DELMENHORST.** A town in the Grand Duchy of Oldenburg, on the Delme, 10 miles southwest of Bremen (Map: Germany, C 2). Wool carding, yarn spinning, jute spinning, and the manufacture of cigars, ironware, linoleum, bricks, and lumber constitute the principal industries. There are also important cattle and horse markets. Pop., 1890, 6828; 1900, 16,573; 1910, 22,516.

**DELMONTE Y TEJADA,** dál-món'tá & tá-há'dá, **ANTONIO** (1783-1861). A Spanish-American historian, juriconsult, and statesman. He was born at Santiago de los Caballeros (Santo

Domingo) and studied law at the University of Santo Domingo. He participated in the campaign against Toussaint l'Ouverture, but in 1804 was compelled to seek refuge in Cuba and ultimately settled at Havana as an official of the government. He wrote a *Historia de Santo Domingo desde su descubrimiento hasta nuestros dias* (Havana, 1853). The first volume was all he succeeded in publishing, but he left two more completed, and notes to bring the account down to his time.

**DE LOACH, ROBERT JOHN HENDERSON** (1873- ). An American botanist, born at Statesboro, Ga., and a graduate of the University of Georgia (class of 1898). He was superintendent of Swainsboro (Ga.) schools (1900), teacher in the United States Indian School at Fort Sill, Okla. (1900-02), and principal of the Statesboro high school (1903-05). After serving as botanist at the Georgia Experiment Station (1906-08), he became professor of the cotton industry at the State College of Agriculture (Georgia) in 1908. In the summer of 1911 he was collaborator at the Bureau of Plant Industry. Besides bulletins on plant diseases and breeding, and magazine articles, he is author of *Rambles with John Burroughs* (1912).

**DELOCHE, de-lôsh', JULES EDOUARD MAXIM** (1817-1900). A French historian and archaeologist. He was born at Tulle and, after having studied law at Bordeaux, entered the government service in 1840, and held various offices in the Ministry of Public Works. In recognition of his works in the field of history, archaeology, and numismatics, he was elected a member of the Academy of Inscriptions in 1871. He died in Paris. Among his publications are: *Etienne Baluze, sa vie et ses œuvres* (1858); *Cartulaires de l'abbaye de Beaulieu* (1859); *Etudes sur la géographie historique de la Gaule, etc.* (1861-64); *La Trustis et l'antrusion royal sous les deux premières races* (1873); *Des monnaies d'or au nom du roi Théodébert* (1886-88); *Etudes de numismatique mérovingienne* (1890). *Les Archiprêtres de l'ancien diocèse de Limoges, etc.* (1899).

**DELOLME, de-lôlm', JEAN LOUIS** (1740-1806). A Swiss jurist, born in Geneva, where he practiced law. Having given offense to the authorities by his publication, *Examen des trois points des droits*, he was obliged to take refuge in England, where, in spite of his literary activity, he lived for several years in great poverty. He returned to his native country in 1776. His principal work is *Constitution de l'Angleterre* (1771), which was translated into English by himself and passed through several editions. He also published, in English, *Parallel between the English Government and the Former Government of Sweden* (1772); *History of the Flagellants* (1777). *Essay Containing Strictures on the Union of Scotland with England* (1787).

**DE LONG, GEORGE WASHINGTON** (1844-81). An American naval officer and Arctic explorer. He was born in New York City, graduated at the United States Naval Academy in 1865, and by 1873 had risen to be navigating officer of the *Junia*, in which search was being made for the lost *Polaris*, the Arctic exploring steamer in which Captain Hall had sailed. To his enthusiasm for polar research thus kindled was due the *Jeannette* expedition, subsidized by James Gordon Bennett, which set out from San Francisco in 1879 with a company of 33, com-

manded by Lieutenant Commander De Long. The *Jeannette* was crushed in the ice north of Siberia, and the party, after traversing the ice on sledges, set out for the land in three boats, of which one was lost at sea. The one containing De Long reached the Lena River; but (except two seamen, who succeeded in reaching a settlement) her crew, including De Long, died of starvation in Siberia. The third, which contained George W. Melville and Lieutenant Danenhower (qq.v.), arrived at the Lena in October, 1881, and after months of search found the bodies of De Long and his companions (March, 1882), which were brought to New York and buried with honor. Consult: De Long, *The Voyage of the Jeannette*, comprising his journals, edited by his widow, Mrs. Emma J. (Wotton) De Long (1883); Danenhower, *The Narrative of the Jeannette* (Boston, 1882); Melville, *In the Lena Delta* (ib., 1885). See POLAR RESEARCH.

**DELOO',** See DUKE.

**DELOD, de-lôr', TAXILE** (1815-77). A French publicist, born at Avignon. He began his career as a journalist in Marseilles and in 1837 settled in Paris, where he became a contributor to several journals, notably the *Charivari*, of which he was editor in chief from 1848 to 1858. Afterward he was connected with the *Siccle* as literary editor. Elected to the National Assembly (1871-76), he voted steadily with the extreme Radical party. He published *Physiologie de la Parisienne* (1841); *Les Matinées littéraires* (1860). *Histoire du second Empire* (1868-75), his principal work.

**DELOORME, de-lôrm', MARION** (1611-50). A notorious French courtesan. At an early period of her life she went to Paris, where her great beauty would easily have secured for her a good match had she not been inclined to a life of licentious intrigue. Almost all the distinguished men of the age were her lovers, among them Cinq-Mars, the great Condé, his brother the Prince de Conti, the Duke of Buckingham, and Cardinal Richelieu. During the first disturbances of the Frondeurs her house was the rallying point of the chiefs of that party, and, in consequence, Mazarin was about to imprison her, when she suddenly died in 1650. A curious tradition sprang up in France during the next century, to the effect that Marion had not died, but had escaped to London, that she had returned to Paris in 1682; that she meanwhile had been twice married, and, finally, that she died in 1706 or, according to others, even as late as 1741. Victor Hugo has made her the subject of a drama, and Alfred de Vigny described her fate in his novel *Cinq-Mars*. Consult J. Peladan, *Histoire et légende de Marion Delorme* (Paris, 1882).

**DE L'ORME, PHILIBERT** (c.1515-70). The earliest of French Renaissance architects in the modern sense; the first, i.e., who practiced architecture as a profession after a special training for it. He belonged to a family of architects and went to Rome in 1534 to study the ancient monuments. After a number of years spent on the works of the palace at Fontainebleau he was appointed architect to the King in 1546. He built the great hall on the bridge at the Château de Chenonceaux, for which he planned a vast extension, which was never carried out. His chef-d'œuvre is the Château d'Anet (1552-59), which he built for Diana of Poitiers, a fine design displaying the new classical tendency

which he acquired in Rome, though still far from the rigidity of the Palladian type. After a period of disgrace Catharine de' Medici employed him to design the palace of the Tuileries (1563), the construction of which he continued until his death. This was a vast project, of which but a small fragment was built, and this by no means worthy of De l'Orme's talent. The lower story was adorned with banded Ionic columns, which De l'Orme's vanity claimed as a new or "French" order. (See TUILERIES.) De l'Orme—or Delorme, as his name is also written—was the author of the earliest French treatise on architecture, *Nouvelles inventions pour bien bastir et à petits frais* (Paris, 1561). Consult: Pattison, *The Renaissance of Art in France*, vol. i (London, 1879); Palustre, *La renaissance en France*, vols. i, ii (Paris, 1879-81); Vachon, *Philibert de l'Orme* (ib., 1887).

**DELOIRME, PIERRE CLAUDE FRANÇOIS** (1783-1859). A French historical painter and lithographer, born in Paris. He was a pupil of Girodet, whose manner he imitated. His art embodies the classical tendencies of the school of David (q.v.). His most important canvases are: "The Death of Abel" (1810), in the Montpellier Museum; "Héro and Leander" (1814); "Raising of the Daughter of Jairus" (1817), in the church of Saint-Roch, Paris; "Descent of Christ into Limbo" (1819), in Notre Dame de Paris; "Cephalus Carried off by Aurora" (1822), in the Museum of Cens, "Foundation of the Collège Royal by Francis I," Versailles Gallery. He also executed mural paintings in the churches of Saint-Eustache, Saint-Gervais, and Notre Dame de Lorette, in Paris.

**DELOS** (Gk. Δῆλος). The smallest but most famous of the Cyclades, called in ancient times Asteria, Orygia, and Cynthus (Map Greece, G 4). It is situated between the islands Rhenea and Myconos. It is about 3½ miles from north to south, and ¾ of a mile from east to west. Near the centre rises the rocky hill Cynthus, about 380 feet high, to the west and north of this hill is almost the only level ground of the island, and here were situated the sanctuary of Apollo and the ancient town. According to the myth, Delos was at first a floating island, but was fastened by chains to the bottom of the sea, or to Myconos and Gyaros by Poseidon or by Zeus, that it might afford a refuge from the jealous Hera for Leto, who there brought forth Apollo and Artemis. Vergil (*Æneid*, iii, 75-77) makes Apollo bind Delos to Myconos, in gratitude for his birth on Delos. From very early times Delos was a sacred island, the centre of the Ionian cult of Apollo, and the scene of a great festival, the Delia, celebrated by the Ionians in the month Thargelion (May-June), and mentioned in the Homeric Hymn to Apollo. Even the Persian general Datis (q.v.), when on his way to attack Athens, spared this island and made a rich offering to the god. After the Persian wars Delos became the centre and treasury of the new league under the presidency of Athens, and when the league was transformed into the Athenian Empire the temples of Delos seem to have passed under Athenian control. See **ATHENS, History**; **GREECE, History** (Ancient History). In 426 B.C. the island was purified by the Athenians, who removed all the dead bodies to the neighboring island of Rhenea and ordered that hereafter no birth or death should occur on this sacred spot. In 422 B.C. they even expelled all the secular inhabitants, but

allowed them to return in the following year. After the fall of Athens, in 404 B.C., Delos seems, thanks to the Spartans, to have regained its independence for a time; but the Athenians soon recovered the suzerainty and seem to have retained it until about 322 B.C., when Delos became a free community, a position which it maintained until about 166 B.C. During this period the island prospered greatly. The successors of Alexander vied with one another in gifts to Apollo, while its central position made Delos a natural centre of commerce. Nor did this prosperity decrease when the Romans once more placed Delos under Athenian rule (166 B.C.), for at the same time all imports and exports were freed from taxation, and during the second and first centuries B.C. Delos was the seat of a large colony of merchants, Italian, Greek, and Eastern. It was a centre of the slave trade, but had few local industries, except the manufacture of a variety of bronze. Sacked during the Mithridatic wars (c.87 B.C.), it never fully recovered, and by the middle of the second century A.D. was deserted by all except those connected with the temple. With the fall of heathendom the island was deserted except by those who visited it to collect building material or to burn its marbles into lime. Today the island is deserted, except by the few shepherds who in the summer cross with their flocks from Myconos or Rhenea.

During the fifteenth and sixteenth centuries the island was plundered for the benefit of European collections, but scientific exploration began only in 1829 with the French scientific expedition under the direction of Blouet. In 1873 Lebeque explored the ancient shrine and grotto on Mount Cynthus, and in 1877 Homolle began excavations in the sanctuary of Apollo. Since then the French School at Athens has conducted numerous and successful campaigns, which have brought to light not only the sacred precinct with its temples, porticos, and altars, but also the wharves and warehouses, the bazars of the merchants, the theatre, the gymnasium, and a number of private houses, belonging apparently to the prosperous period of the second century B.C. In sculpture the island has yielded some important archaic statues of the sixth century B.C., such as the "Nike" of Archermos, the statue dedicated by Nicandra, and some female figures similar to those found on the Acropolis of Athens, and, of later art, a fighting warrior and a fine copy of the "Diadumenos" of Polyclitus (q.v.), as well as many other works, often, unfortunately, in very poor preservation. The chief harvest has been in the inscriptions, many of which are still unpublished. In addition to the decrees and dedications always common in sanctuaries, these include long lists of the treasures of the temple and also an important series of accounts, showing the receipts and expenditures of the temple, carefully itemized, and throwing a flood of light on the financial administration of a Greek shrine. Consult: Lebeque, *Recherches sur Delos* (Paris, 1876); Von Schoeffer, *De Delis Insule Rebus* (Berlin, 1889); Homolle, *De Antiquissimis Dianæ Simulacris* (Paris, 1885) and *Les archives de l'intendance sacrée de Delos* (ib., 1886)—this work gives a plan of the excavations; *Bulletin de correspondance hellénique*, vol. i et seq. (ib., 1877 et seq.); Frank, "Commercialism and Roman Territorial Expansion," in the *Classical Journal*, vol. v, pp. 99-110 (1909); this article

throws much light on the relation of the Romans to Delos. Good summaries of the history and antiquities are to be found in Jebb, *Journal of Hellenic Studies*, i (London, 1881); Diehl, *Excursions in Greece*, Eng. trans. by Perkins (New York, 1893); *Guide Joanne, Grèce*, vol. ii. Consult also: Schoeffer, in Pauly-Wissowa, *Realencyclopädie der klassischen Altertumswissenschaft*, vol. iv (Stuttgart, 1901); Homolle and Holleaux, *Exploration archéologique de Delos* (parts i-iii, Paris, 1910-11); Larfeld, *Griechische Epigraphik* (Munich, 1913); Ferguson, *Hellenistic Athens* (New York, 1911). For the theatre, consult Haigh, *The Attic Theatre* (3d ed., Oxford, 1907); for works of art found at Delos, consult Gardner, *A Handbook of Greek Sculpture* (London, 1911) and *Principles of Greek Art* (ib., 1913). Consult, finally, Baedeker, *Greece*, 4th Eng. ed. (Leipzig, 1909).

**DELOS**, CONFEDERACY OF. See **DELOS**: **GREECE**, *History* (Ancient History).

**DELPHI**, δελφί (Gk. Δελφοί, *Delphoi*). An ancient town of Phocis, Greece, celebrated for its oracle of Apollo (q.v.). It was situated 2130 feet above sea level, about 6 miles inland, north of an indentation in the northern shore of the Corinthian Gulf (Map: Greece, Ancient, C 2). In the Homeric poems it is always called Pytho. It was situated on the southern slope of Mount Parnassus (q.v.), where above the steep and narrow valley of the Pleistos rise the twin cliffs of the Phætriade, the 'Shining Rocks.' These precipices are separated only by a narrow chasm, from which issues the famous fountain of Castalia (q.v.). The temple, theatre, and stadium were situated at the foot of the western cliff, and about them the town must have gathered, though the gymnasium and a sanctuary of Athena lay to the east. Below the terrace on which the town lay, the land slopes abruptly to the bed of the Pleistos. The natural surroundings are full of wild grandeur; from underground caverns streamed cold vapors, and the region was liable to violent shocks from earthquakes.

The place seems early to have become the seat of a worship of the earth shaker, Poseidon, and the earth mother, Gæa. Somewhat later, but still at a very early date, the worship of Apollo was introduced and took the place of these cults. Since Apollo was a prophetic god, Delphi became the seat of an oracle, which soon attained great fame. At first the responses seem to have been given from the rustlings of the laurel, as at Dodona (q.v.) from the oak. Later, the Pythia—at first a maiden, subsequently a woman over 50 years old, garbed as a maiden—after drinking from the holy spring and chewing laurel leaves, took her seat upon a tripod in the *adyton*, or inner shrine. Her utterances were taken down and put into hexameters by poets attached to the temple. During the greatest prosperity of the oracle three women relieved one another in this exhausting task. At the head of the temple service stood two priests, holding office for life and seemingly in charge of the oracle. The oracle was consulted by states and kings in matters of national policy, and also by private persons on all manner of personal matters, such as voyages, business ventures, marriages, and other details of daily life. Its fame brought it great wealth and many splendid offerings, among which those of Cæsus and Gelon of Syracuse were especially famous. In the earliest source, the Homeric hymn to Apollo, Delphi appears in dependence upon the

Phocian city of Crisa, near the Corinthian Gulf, which controlled access from the sea, and through the later political history of the place this early claim of the Phocians to the control of the oracle keeps recurring until the conquest of Philip of Macedon. The acts of Crisa led to the first of the Sacred Wars (q.v.), in which the Amphictyonic Council (q.v.) of Thermopylæ first appears as a guardian of the oracle. In 590-589 B.C. Crisa fell, and the first celebration of the Pythian games occurred; in 582-581 B.C. the fort was captured, the harbor filled up, and the whole plain placed under a curse. On this occasion another celebration of the games occurred, and from this time they were celebrated every four years. In 548 B.C. the stone temple, said to have been built by Trophonius and Agamedes, was burned, and the priests at once collected subscriptions from all Greece, and even from foreign parts, for its reconstruction. The work of reconstruction was undertaken by the Alcmaeonidæ (q.v.), then exiles from Athens, who did more than they were required to do, by employing Parian marble for the east front instead of the *poros*, or limestone, specified in the contract. Some fragments of sculpture found by the French seem to belong to this building. During the Persian war the oracle showed a pro-Persian spirit, though later the priests declared that supernatural aid had turned to flight a Persian plundering expedition (480 B.C.). In spite of its prophecies of defeat Delphi was richly rewarded by the Greeks from the Persian booty. During the fifth century Delphi was adorned by the Greek states with treasures to contain their offerings, as well as with many works of art commemorative of victories over their enemies. About 373 B.C. the temple suffered severely, and once more collections were invited from the Greek states for its restoration, which does not seem to have been completed till 323 B.C. Before that time, however, an attempt of the Phocians to reassert their control of the oracle led to the third Sacred War (357-346 B.C.), which ended in the triumph of Philip II of Macedon (q.v.). About 300 B.C. Delphi passed into the power of the Ætolian League, and when (278 B.C.) the Gallic invasion was repelled (see **BRENNUS**, 2), we hear once more of the supernatural powers that drove back the robbers from the temple of Apollo.

During the years that followed Delphi seems to have lost much of its old importance, though the inscriptions show that offerings were still made there, and honors were bestowed on benefactors of the community. Under the Romans it enjoyed only spasmodic prosperity: one Pythia sufficed for the inquirers of the oracle. Though some of the emperors endeavored to restore some of the fallen splendor, others found in the mass of statues and works of art a convenient source for the decoration of Rome. Nero is said to have carried off 500 statues, while Constantine, along with many other treasures, removed to Constantinople the serpent column which had formed part of the offering after the victory at Platea (q.v.), and still bears the names of those Greek states which fought against the Persians (it stands now in the Hippodrome at Constantinople). Later Delphi became the site of a Christian church, but the ruins finally vanished, and until 1892 the site was occupied by the village of Castri (q.v.). In 1880-82 Haussoullier, and, in 1887, Pomtow had conducted excavations at Delphi. In 1892

the French School at Athens, under the direction of Homolle, began excavations, which have resulted in laying bare the entire sacred precinct, including many treasuries and other buildings, as well as the altar, temple, theatre, and stadium; the theatre and the stadium in particular are well preserved. The inscriptions found number over 4150, many of them documents of great importance for the history of Greece, especially for the history of the Delphic Amphictyony. The sculpture also has thrown much light upon the history of art during the later sixth and early fifth century B.C., while it seems almost certain that in a marble statue we have a contemporary copy of a bronze by the great Lysippus. Consult E. A. Gardner, *Six Greek Sculptors*, pp. 217-223 (London, 1910). Another wonderful work of art from Delphi is the "Bronze Charioteer" figured and described by Gardner in the work just named (pp. 49-53). The reports of these excavations are to be found in the *Bulletin de correspondance hellénique*, vols. xvii et seq. (Paris, 1893 et seq.; for plans, see vols. xvi, xvii), and the *Comptes rendus de l'Académie des Inscriptions et Belles Lettres* (ib., 1893 et seq.). Consult also: Mommsen, *Delphika* (Leipzig, 1878); Pomtow, *Beitrag zur Topographie von Delphi* (Berlin, 1889); Hiller von Gaertringen and Pomtow, in Pauly-Wissowa, *Realencyclopädie der klassischen Altertumswissenschaft*, vol. iv (Stuttgart, 1901). Frazer, *Pausanias*, vol. v (2d ed., London, 1913); Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909); Larfeld, *Griechische Epigraphik* (Munich, 1913).

**DELPHI.** A city and the county seat of Carroll Co., Ind., 60 miles north by west of Indianapolis, on the Wabash River, and on the Wabash, and the Chicago, Indianapolis and Louisville railroads (Map: Indiana, C 2). It has good water power and contains lime works, planing and flour mills, canning factory, carriage and wagon works, paper mills, button factory, stone crushers, etc. There are municipal water works and a public library. Pop., 1890, 1923, 1900, 2135, 1910, 2161.

**DELPHIN CLASSICS** (Lat. *delphinus*, dolphin, from Gk. δελφίς, *delphis*, δελφίρ, *delphin*, dolphin). A famous edition of the Latin classics, published in France in the seventeenth century. It was prepared by 39 of the best scholars of the time, under the editorship of Pierre Daniel Huet (q.v.), tutor to the Dauphin (q.v.), son of Louis XIV. The title-pages bear the words *In usum Hereticissimi Delphini*, hence the name: all the volumes of the original edition have an engraving of Arion (q.v.) and the dolphin. The Delphin Classics comprise 64 volumes (1674-1730). They possess little value now. Consult Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

**DELPHINIA.** See GREEK FESTIVALS.

**DELPHINTUM.** See LARKSPUR.

**DELPHOS.** A city and railroad centre in Allen and Van Wert counties, Ohio, 15 miles northwest of Lima, on the Miami and Erie Canal, and on the Pennsylvania Company, the Toledo, St. Louis, and Western, the Northern Ohio, the Ohio Electric, and the Cincinnati, Hamilton, and Dayton railroads (Map: Ohio, B 4). It has railroad repair shops, marble and granite works, paper and flour mills, brewery, and manufactories of galvanized iron products, oil cans, printing presses, furniture, pipe, etc. Settled in 1834, Delphos was incorporated in

1851 as a village and became a city in 1913. Its government is administered by a mayor, elected every two years, and a municipal council. The city owns and operates its water works and contains a Carnegie library. Pop., 1900, 4517; 1910, 5038.

**DELPINO**, dāl-pe'no, **FEDERIGO** (1833-1905). An Italian botanist, born at Chiavari (Genoa). He studied at the University of Genoa, became an official in the customs department, and in 1871 was appointed professor of natural history in the School of Forestry at Vallombrosa. In 1875 he was called to the chair of botany at the University of Genoa and in 1894 to a similar chair and the curatorship of the botanical gardens at the University of Naples. His publications, which have contributed much to the study of plant biology, include *Sulla darwiniana teoria della pangenesi* (1869); *Teoria generale della filotassi* (1883); *Funzione mirmeofila nel regno vegetale* (2 parts, 1886-88); *Fiore doppi* (1887).

**DELPIT**, dēl'pē, **ALBERT** (1849-93). A French novelist and dramatist. He was born in New Orleans, the son of a wealthy tobacco merchant, and at an early age was sent to France to complete his studies. Devoting himself to literature, he first became a contributor to newspapers founded by the elder Dumas towards the end of the Second Empire. Several poetic productions were honored with prizes by the Academy. These were *L'Apothéose de Lamartine* (1869); *L'Invasion* (1871), a volume of verse; and *Le repentir, ou récit d'un curé de campagne* (1878). His earlier dramatic efforts did not meet with success, but *Le fils de Coralie* (1879), dramatized from his novel of the same title, was received with great favor, and several of his subsequent dramatizations held the stage for some time, especially *Le père de Martial* (1881). He was, however, at his best as a novelist. Among his productions in this field, for the most part descriptive of life in fashionable society, and many of which appeared first in the *Revue des Deux Mondes*, are: *La vengeance* (1874); *Les fils de joie* (1877); *Le mariage d'Odette* (1880); *La marquise* (1882); *Les amours cruelles* (1884); *Nolange de Croix-Saint-Luc* (1885); *Made-moiselle de Bressier* (1886); *Thérèse* (1888); *Disparu* (1888); *Comme dans la vie* (1890); *Belle madame* (1892). A collection of poems appeared under the title *Les dieux qu'on brise* (1881). During the Franco-German War he entered the army and, serving with distinction, was decorated with the Legion of Honor (1871). He died in Paris.

**DELPIT**, EDOUARD (1844-1900). A French author and journalist, born in New Orleans, U. S. A. He studied in France, where he was naturalized in 1868, and in 1873 became sub-prefect of Nérac. Subsequently he assumed control of the *Union Nationale*, a newspaper of Montpellier. He published a volume of poems, *Les monnaies* (1871), and *Paule de Brusange* (1887), *La vengeance de Pierre* (1888), *Chaine brisée* (1890), *Marcelle* (1894), *Sans merci* (1898), *La tation* (1899) — all works of fiction.

**DEL POLLAJUOLO**, dēl pōl'la-hwō'lo, **SIMONE**. See POLLAJUOLO.

**DEL RIO**, dēl rē'ō (Sp., of the river). A city and the county seat of Val Verde Co., Tex., 170 miles west of San Antonio, on the Galveston, Harrisburg, and San Antonio Railroad (Map: Texas, B 5). Notable features of the city are the San Felipe springs, a hospital, two

convents, and the Federal building. It has cotton gins and other industrial establishments, and is the centre of a truck-farming and cattle-raising region. Pecans, wool, hides, live stock, fruit, and vegetables constitute important exports. Del Rio has adopted the commission form of government. Pop., 1914 (local est.), 9000.

**DELSARTE**, *del-sart'*, FRANÇOIS ALEXANDRE NICOLAS CHÉRI (1811-71). A French-American musician, born in Solesmes, France. He was a pupil of the Conservatoire, was for a time a tenor singer in the Opéra Comique, composed a few melodies, and wrote several romances, but is chiefly known as a teacher in singing and declamation. He sought by an elaborate system to present the art of expression as a complete science. His theories have been widely adopted, and are handed down mainly by tradition, as DELSARTE wrote very little about them.

**DELSARTE SYSTEM**. See GYMNASICS.

**DELTA** (Lat., from Gk. *δέλτα*, fourth letter of the alphabet, anything shaped like the letter Δ, from Heb. *daleth*, door, name of the fourth letter of the alphabet). An alluvial plain occurring at the mouth of a river. The name was applied originally by the Greeks to the land area at the mouth of the Nile, from the resemblance in shape to their letter Δ. All rivers carry finely divided sand and mud in suspension, and, as their currents are checked upon entering quieter waters, the solid particles are deposited upon the bottom of the channels near the river mouths. The deposit gradually increases in area and also in thickness until it reaches the surface, and then by floods and by growth of vegetation it is raised beyond the limits of high water. At the head of each land area thus built up, the river divides into diverging branches, forming a triangle the base of which fronts upon the sea. A delta may occur at the junction of two rivers or at the entrance of a river into sea or lake; a fan-shaped deposit resembling a delta is sometimes found, also, where a river debouches from a mountainous region upon a plain. The large deltas are found at the mouths of great rivers which discharge into comparatively quiet seas. Coastal currents and strong tidal action remove the river deposits before they accumulate to any considerable thickness. The area of a delta varies with the size of the river, the amount of sediment carried and the length of time it has been deposited, and the relative quietude of the sea. The combined delta of the Ganges and Brahmaputra in India occupies more than 50,000 square miles, and the deposit has been found in places to be nearly 500 feet thick; that of the Nile is 200 miles wide at the base of the Mediterranean Sea and 100 miles long. The Mississippi delta is irregular in form, but it affords a fine illustration of the manner in which a river extends its channel seaward. Its area is about 12,300 square miles, and it is advancing into the Gulf of Mexico at the rate of about 260 feet a year. In Italy the Po has constructed a delta so rapidly that the city Adria, which in ancient times was a port of sufficient importance to have given its name to the Adriatic Sea, is now about 15 miles inland. Delta lands are usually fertile, but by reason of their low elevation they are often unhealthy, and their cultivation is hindered by inundations during storms and floods. Consult Geikie, *Text-Book of Geology* (London, 1903). See RIVER; SHORE.

**DELTOID MUSCLE**. See MUSCLE.

**DELUC**, *de-lyuk'*, JEAN ANDRÉ (1727-1817). A Swiss geologist and meteorologist. He was engaged in mercantile pursuits until nearly 50 years of age; but within that time, assisted by his brother, he assembled a fine museum of mineralogy and natural history. He removed to England in 1773, was made a fellow of the Royal Society, and appointed reader to Queen Charlotte, a position which he held for many years, and which afforded him ample time for study. He invented a hygrometer, a portable barometer, etc., and carried out many interesting experiments in physics and meteorology. His principal geological work is *Lettres physiques et morales sur les montagnes et sur l'histoire de la terre et de l'homme* (1778). In this work he endeavored to reconcile the Mosaic account of creation with the data of science by extending the six days of Genesis to so many geological epochs. In 1809 he described the dry pile or electric column in a paper sent to the Royal Society. He also published *Recherches sur les modifications de l'atmosphère* (2 vols., 1772; 2d ed., 4 vols., 1784); *Traité élémentaire de géologie* (1809); *Voyages géologiques en France, en Suisse, et en Allemagne* (2 vols., 1813).

**DELUGE** (OF., from Lat. *diluvium*, flood, from *diluere*, to wash away, from *di-*, away + *luere*, to wash). A flood of waters supposed by many peoples to have submerged the whole earth, or a large part of it, in primeval times, involving the destruction of all, or nearly all, life upon the planet. The most unmistakable evidence of a belief in such a flood is found in the literary remains, not only of the ancient Hebrews, but also of India, Persia, Babylonia, Syria, Asia Minor, and Greece. In one form or another it also seems to have existed among the aborigines of America and Polynesia, according to the testimony of Christian missionaries, whose accounts, however, cannot always be accepted without caution. On the other hand, there is practically no trace of a flood story in Africa, not even among the ancient Egyptians, though an earlier form of one may have been familiar in the Nile valley. Aside from Greece, and possibly Luthuania, there is none in Europe.

Of course the most obvious way to account for this widespread story is to suppose that there really was a flood. The fact that the Bible gives a detailed and intelligible account of one was formerly generally regarded by Jews and Christians as unquestionable evidence that it occurred; and the story of it in other nations was considered remarkable confirmation of the Bible narrative. The organic remains found everywhere in the rocks of the earth's surface were also held to prove that the waters had covered every known country and risen over the highest hills. With the progress of geology it became evident that most of the stratified rocks demanded an earlier origin than a few thousand years, and the influence of the deluge was consequently restricted to the slightly altered superficial deposits. But many of these were found to belong to a period vastly anterior to any historical epoch and to have been produced by a long-continued action under uniform conditions, viz., regional glaciation, which was most active during that portion of geological times known as the Glacial period. Consequently there arose a tendency to regard a Noachian deluge as having been of merely local extent, and this explanation was adopted by

certain commentators on the narrative of Genesis. At the present time the most important discussion of the subject belongs to the department of comparative religion and mythology.

By far the earliest and most important of all deluge stories outside of the Bible is the Babylonian. Through the excerpts from Berossus (c.330-260 B.C.), made by Alexander Polyhistor (died c.40 B.C.), and preserved by Josephus, Eusebius, and Georgius Syncellus, one version of the Babylonian story has long been familiar. It relates how, in order to escape the flood, the Babylonian King, Xisuthrus, was commanded to enter a vessel with wife, children, friends, and a pilot, and to steer "towards the gods"; and how, when the waters had subsided, he sent out birds three times, grounded on a Kordyanian mountain in Armenia, disembarked, sacrificed to the gods and was translated. In 1872 George Smith discovered another version, forming the eleventh tablet of the Gilgamesh epic. According to this story, Anu, Ellil, Ninip, and Ennugi sent out a destroying flood (*abubu*), but Ea, determined to save Ut-napishtim of Shurippak, advised him to "build a house, to construct a ship," and to take with him into it "seeds of life of all kinds." He accordingly constructed his house, or boat, coated it within and without with bitumen (*kupru*), and made apartments in it. His possessions, family, relatives, laborers, the cattle and the beasts of the field, Ut-napishtim brought into the house. Then the rain fell, the storm arose, and darkness covered the earth. All living beings were destroyed, except those in the house. On the seventh day Ut-napishtim opened the window, and soon the ship grounded on the mountain of Nisir. Seven days later he sent out a dove, a swallow, and a raven. The dove and the swallow returned, the raven did not. Ut-napishtim offered a sacrifice on the mountain, and the gods "smelt the pleasant odor." Ea rebuked Ellil for ordering such a deluge, when he might have punished men by beasts, famine, or pestilence, and Ishtar, who had already during the deluge expressed her sympathy with mankind, now lifted up her gems made by Anu (probably the rainbow), which would remind her forever of the flood. Ea pacified Ellil's disappointment at the deliverance of Ut-napishtim, and Ellil himself went on board the ship and announced that Ut-napishtim and his wife were thenceforth to be gods and live "afar off, at the mouth of the rivers." These tablets containing the Gilgamesh epic were found in the library of Asurbanipal (668-625 B.C.) at Kuyunjik, but they were only copies of originals found in turn by Asurbanipal's scribes in the temple archives at Uruk (modern Warka). Several fragments have since been found, giving the dimensions of the ark, and directions concerning food, treasures, men, and animals to be taken into it. Especially interesting is a tablet published by Peiser (*Zeitschrift für Assyriologie*, Leipzig, 1889), giving a map of Babylonia, surrounded by the ocean at the time of Ut-napishtim "in the year of the great serpent," and probably dating from the ninth century B.C. An earlier reference to the flood is in a fragment published by Scheil (*Recueil de travaux*, Paris, 1878), dated the 28th of Shebat of the year when Ammi-zadugga (1773 B.C.) built the fortress of Ammi-zadugga. The hero of the flood (*abubu*) is here called Atra-hasis, which, reversed (Hasis-atra), is evidently Berossus' Xisuthrus. A fragment like-

wise referring to Atra-hasis was published by Jensen in *Keilinschriftliche Bibliothek*, vol. VI (Berlin, 1900). Another fragment has more recently been published by Hilprecht, *Der Neue Fund zur Sinfutgeschichte* (Leipzig, 1910). While he assigns it to the Isin period, other Assyriologists are inclined to date it in the Kassite period (1761-1185 B.C.). Finally, Poebel in 1913 discovered a Sumerian original coming from Nippur. The hero's name is here Ziusgaddu. There are references to Ea's advice, the seven days of storm, the great boat, the sacrifice, and the defilement of Ziusgaddu.

The narrative in Genesis (chaps. vi.-ix) is regarded by many modern critics as made up of two versions interwoven. This was recognized by Jean Astruc (q.v.) as early as 1753. Using as a clue the divine names Yahwe and Elohim, he roughly outlined the two accounts. At the present day his intuition has been widely accepted, and scholars proceed to rearrange the material and assert that the Yahwistic narrative is found in Gen. vi. 5-8; vii. 1-5, 7-10, 12, 16b, 17, 22, 23; viii. 26, 3a, 6-12, 13b, 20-22. The flood is represented as sent because of man's wickedness. It is occasioned by a rain lasting 40 days. Noah is saved with his family in an ark, or house. With him are a pair of all unclean animals, and seven pairs of all clean animals. The flood comes after seven days and destroys all living things on the earth. At the end of 40 days Noah sends out a raven, which does not return; then a dove, which returns with an olive twig; and, after seven days the dove is again sent out, and this time does not return. Seven days later Noah disembarks, builds an altar, and offers a sacrifice of which Yahwe smells the "rest-giving odor" and promises not to destroy the world again. Portions of another narrative are found in Gen. vi. 9-22; vii. 6, 11, 13-16a, 18-21, 24; viii. 4, 5, 13, 14-19, ix. 1-17. Noah is represented as a just and perfect man whom Elohim desires to save and therefore commands to build an ark, giving its exact measurements. Noah is to take into it his family and of all living beings a pair. The flood is brought about by the subterranean waters of the great abyss breaking through the openings in the earth's crust and the windows of heaven being opened. It begins in the six hundredth year of Noah's life, on the seventeenth (or more probably, according to the Greek version, the twenty-seventh) day of the second month. It increases during 150 days, or five months of a solar year, and begins to decrease in the seventh month. The ark then grounds on one of the mountains of Ararat (Urartu; see *ITALIANS*). The waters decrease until the tenth month, when, on the first day, the tops of the mountains are seen. On the first day of the first month in the six hundred and first year of Noah's life the ground is dry, and on the twenty-seventh of the second month, consequently after a full solar year, Noah leaves the ark and is blessed by Elohim, who points to the bow in the sky as a guarantee that a flood shall not again occur.

The striking similarity between the Genesis narrative and the Babylonian account is manifest, and has been explained in two ways. Both records have been thought to be independent developments of an old Semitic tradition; and the one has been said to be copied from the other. Some scholars who, in view of the uncertainty of the textual transmission, are not inclined

to attach so much weight to the alteration of the divine names in the Masoretic text admit the probability of redactional additions due to a different tradition. The fact that the story has now been found in the Sumerian renders the second alternative more probable. Those who believe that the Hebrew narrative is taken from the Babylonian differ as to the time when this is likely to have taken place. In Genesis iv the history of existing tribes seems to be traced back to their earliest progenitors without the interruption of a flood. This has given rise to the theory that one of the Pentateuchal sources did not contain this story originally, but that it was interpolated either after contact with the Assyrians in the eighth century, or, since the waters of Noah are first quoted by Deutero Isaiah, not long before 540 B.C. by a Babylonian Jew possibly at Uruk, and that the story was afterward supplemented by Ezra, who was familiar with a version having greater affinity to the Sippara recension. On the other hand, it is held by some scholars that the story found its way into Syria before the Hebrew invasion, as was the case with other myths (see BABYLONIA), and that it was presented in different recensions in Palestine. Absence of polytheism in the Hebrew is an unquestionable advance in thought, but it was not made without a sacrifice. Instead of a divided council of gods in which, through Ishtar and Ea, sympathy with the whole human race found fine expression, and mercy won the day over justice unsoftened by kindness, the one all-powerful God became responsible for the ruthless destruction of life, and His partiality to those finding favor in His eyes became accentuated.

As to the origin of the Babylonian story, and also of the Hebrew narrative, if it be independent of the former, it has been maintained by some scholars that an actual occurrence, such as the incursion of a tidal wave through an earthquake, the destruction of a single city through a rainstorm, the flooding of some district from a system of canals not properly protected, or the annually recurring inundation of a river, may have given rise to it. But it is far more probable that the Babylonian account, at any rate, originated in a myth describing the passage of the sun god in his boat through the heavenly ocean. When the present order of the world was regarded as the creation of the sun god, after a successful conflict with the earth-encircling ocean, it is natural that this myth should, in course of time, take the form of a deluge story relating the escape of a solar hero in the year of the great serpent. This conclusion is also indicated by the fact that the story of the flood is told on the eleventh tablet of a series manifestly representing the course of a solar personage through the signs of the zodiac. In the great cosmic year the sun god meets the cataclysm of waters in Aquarius, as in the solar year he encounters in Shebat, the eleventh month, the inundation of the river.

This mythical origin is believed to be confirmed by the flood stories of Greece, India, and Persia, as well as by the American and Polynesian accounts. The story of Deucalion's flood is known to us through Pindar (died c.440 B.C.), *Olymp.*, ix, 37 et seq.; and Ovid, *Metamorphoses* l, 240; that of Ogyges through Nonnus (c.400 A.D.), *Dionysiaca*, iii, 96; that of Dardanus also through Nonnus, *ib.*, iii, 215 et seq. Deucalion means "the little Zeus," and this young sun

god steers in his ship for Parnassus, the mountain of the gods. The Phrygian myth, of which the bronze coins of Apamea bear witness, in the third century A.D., has evidently been influenced by the Jewish account, as the name "Noe" shows; and the same is true of the Syrian story in Lucian's *De Dea Syria*, xii. On the other hand, the Indian flood story is quite independent of the Semitic. It is found in its earliest form in *Satapathabrâhmana* (c.600 B.C.); then in the *Mahâbhârata* and *Bhagavata Purâna*. Manu, son of Vivisvat, is a solar hero. His divine character is shown by the fact that after the flood he creates not only a new human race, but even gods. Brahma in the form of a fish carries him through the waters. The Iranian story (*Vendidad*, ii, 46 et seq.) is in too fragmentary a condition to permit a conclusion. It is uncertain whether the flood is in the past or in the future. Yima seems to be identical with Mimer; if so, the myth belongs to a different order. The medium through which the Mexican, Peruvian, and Cuban flood stories have come to us renders it difficult to determine their original form; but the somewhat better authenticated Polynesian stories seem beyond a doubt to have their origin in a sea myth. **DELUSION.** See INSANITY.

**DELVAU**, del'vô', ALFRED (1825-67). A French author. He was born in Paris, the son of a tanner, and after having been secretary to Ledru-Rollin in 1848, while the latter was Minister of the Interior, he devoted himself entirely to literary pursuits. He became a prolific writer and produced works of the most varied description, among which his skillful delineations of Parisian customs and curious phases of life are the most interesting and may lay claim to some merit as contributions to the local history of civilization. Of these may be quoted: *Grandeur et décadence des grisettes* (1848); *Les dessous de Paris* (1860); *Histoire anecdotique des cafés et des cabarets de Paris* (1862); *Les Cythères parisiennes* (1864); *Les heures parisiennes* (1866); *Les lions du jour* (1867). He also published: *Histoire de la révolution de Février* (1850); *Les murailles révolutionnaires* (1851), a curious collection of decrees and proclamations, placarded during the Second Republic; *Au bord de la Bière, impressions et souvenirs* (1854); *Gérard de Nerval, sa vie et ses œuvres* (1865); *Henri*

*Murger et la Bohème* (1866); *Les sonneurs de sonnets, 1640-1866* (1867). Under the pen name of "Junius" he contributed a lively series of letters to the *Figaro* in 1861.

**DELVAUX**, dël'vô', LAURENT (1695-1778). A Flemish sculptor. He was born in Ghent and studied his art under Gery Heldenberg and Dieudonné Plumier in Brussels. In 1717 he went to London, where he spent nine years and executed numerous works for Westminster Abbey and other churches and for palaces, partly in conjunction with the sculptor Pieter Scheemaecker, of Antwerp. From 1727 to 1733 he studied antique art in Italy and, after his return to Brussels, was appointed court sculptor to the Regent Maria Elizabeth and later to Duke Charles of Lorraine, for whom he modeled busts of Maria Theresa and Louis XV. He afterward settled at Nivelles and there practiced his art until his death. His productions, characterized by vigorous treatment, show the influence of classic art, and his religious works also that of Bernini. They include a colossal statue of Hercules in the New Museum of Brussels; the mausoleum of Leonhard van der Noot in the Carmelite Church, Brussels; a pulpit, representing the "Tree of Life," in the cathedral in Ghent—the best specimen of Flemish sculpture in the eighteenth century; a statue of St. Livin in the Museum in Ghent.

**DELVIGNE**, dël've'ny', HENRI GUSTAVE (1799-1876). A French soldier and inventor, born in Hamburg. He became a captain in the French infantry service, from which he resigned on the outbreak of the revolution of July (1830). In 1826 he invented a rifle known by his name. In this rifle the chamber was smaller than the bore, with which it was connected by a spherical surface equal in radius to the ball used. The powder was poured from the muzzle into the chamber, upon which the ball rested when dropped into the bore. The ball was then made to take the rifling grooves by ramming. This invention marks an important step in the improvement of the rifle. Delvigne also devised some life-saving apparatus, particularly life rockets. His publications include *Exposé d'un nouveau système d'armement pour l'infanterie* (1836).

**DELYANNIS**, or **DELJANNIS**, THEODOROS (1826-1905). A Greek statesman, born at Kalavryta, in the Peloponnesus. He studied at Athens and entered the government service (Department of the Interior) in 1843, and was rapidly promoted. He was Minister of Foreign Affairs in the provisional government of 1862-63 and Minister to France in 1867. In the cabinets from 1868 to 1878 he held office, either as Minister of Foreign Affairs, or of Finances, or of Worship and Instruction. He represented Greece at the Berlin Congress in 1878 and obtained an extension of territory for his country. In 1885 he formed a new ministry, but his policy led to a blockade of the Greek coast by a fleet of the Great Powers, and he resigned in 1886. He was Prime Minister again in 1890-92, but his mismanagement of finances led to his dismissal. He held the office a third time from 1895 to 1897, when he involved Greece in the war with Turkey and was obliged to resign. He was Premier again in 1902-03 and 1904-05. On June 13, 1905, he was assassinated by a gambler whose class interests he had antagonized. His political history was for the most part nothing but opposition to Trikoupis (q.v.).

VOL. VI.—42

than whom he was more popular, but not a greater statesman.

**DEMADES**, dêm-a'dês (Gk. Δημάδης, *Dê-madês*). A gifted Athenian orator and unscrupulous politician of the fourth century B.C. For the 12 years preceding Alexander's death he was a leader in Athens with Phocion (q.v.), and so was the enemy of Demosthenes. Though friendly to the Macedonians, he accepted bribes from the other side; for this he was fined several times and at last deprived of his civil rights. When Antipater was advancing on Athens in 322 B.C., Demades was restored to full standing as a citizen, and he and Phocion were sent as ambassadors to him. Their acceptance of the terms offered, terms which were unfavorable to Athens, was made the basis of a charge that they had been bribed. Some years later Antipater discovered that Demades had been false to him, and he put him to death (c.318 B.C.) None of his speeches is extant; in antiquity 14 orations were current under his name, but they were all recognized to be spurious. Extracts from one of these (*Περὶ Δουλοκρατίας*, *Peri Dûlokrâtias*) are edited by Haupt in *Hermes*, vol. xiii, pp. 498 et seq. We have also a collection of sayings attributed to him, *Demadea*. Consult Blass, *Attische Beredsamkeit*, iii (Leipzig, 1887-93).

**DEMAIN**. See **DEMESNE**.

**DEMAND**. A technical term of the common law, signifying a legal claim or obligation. It is defined by Lord Coke as "a term of law, of an extent greater in its signification than any other word except claim" (*Co Lit*, 291). In addition to the claims enforceable by actions, such as contracts, debts, obligations, etc., it includes, as well, all rights enforceable by entry, by seizure of goods, or by any other act. A release of all demands, therefore, is the most comprehensive release that can be given. The usual form of "general release," as it is called, is to release "all claims and demands whatsoever." See **RELEASE**.

The term "demand" is also employed in law in a narrower sense, derived from its general signification of a request, or summons, addressed to another in legal form, calling upon him to perform a legal duty which he owes to the demandant. Such a demand is frequently necessary to fix an inchoate legal obligation and to entitle the claimant to bring an action for its enforcement. Thus, under ordinary circumstances, no right of action arises for a breach of promise to marry unless a previous demand can be shown, and the same is true of all contract obligations in which the time of performance is not definitely fixed, as well as of others in which the time is not a material element. So, in other classes of rights, a demand and its refusal are frequently necessary to give to a wrongful act the sharpness and definiteness requisite to make a legal remedy available. For example, where goods are wrongfully detained by a finder, or by any other person whose original possession thereof was lawfully acquired, he must refuse a demand for them before he becomes liable in trover for a conversion; and so, before abating a nuisance, either personally or by action, a demand must usually be made upon the person maintaining it.

There are other cases in which, though a definite default has been made, entitling the injured party to sue without further notice, a demand for performance may yet be necessary

to enable him to avail himself of some more drastic remedy; as in the case of a failure to pay rent at the stipulated time, though an action will lie for the breach of contract, the landlord cannot enter for breach of condition and put an end to the lease without previous demand. It should be added that, in all cases in which a demand is requisite to fix a legal liability, the requirement is dispensed with if the party in default has put it out of his power to comply with it, and in some jurisdictions the courts have gone so far as to hold a demand unnecessary in all cases in which it would probably have been unavailing. See **BREACH**; **CONVERSION**; **LIABILITY**; **QUASI CONTRACT**; and consult the authorities referred to under these titles.

**DEMAND AND SUPPLY.** In political economy demand signifies the amount of a commodity that will be taken at a given price; supply the amount that will be offered at a given price. In the case of most commodities appearing on the market, the volume of demand increases and the volume of supply diminishes with every decline in price, and vice versa. There must be some price at which the volume of demand just equals that of supply; and this is the price that tends to rule in the market. Hence the axiom of political economy that price is determined by the equation of demand and supply.

While classical political economy explained prices current on the market by the equation of demand and supply and had no other formula even for the permanent prices of objects not reproducible, for goods that could be produced by labor another law governed prices in the long run—cost of production. If market prices, fixed by demand and supply, exceeded cost of production, supply would increase until prices were forced to a lower level; if market prices were inferior to cost, supply would diminish until prices rose. It is to be noted that the law of costs operates only through the mechanism of demand and supply.

In recent economic theory the law of demand and supply is accepted as a preliminary step in reasoning, but chief interest is held to centre in the forces underlying demand and supply. See **POLITICAL ECONOMY**.

**DEMARATUS** (Lat., from Gk. Δημάρατος, Demaratus). A Spartan king (c.510 to 491 B.C.). By the machinations of his colleague, Cleomenes (q.v.), he was deposed. He subsequently repaired to the Persian court and accompanied Xerxes as a counselor on that monarch's expedition against Greece.

**DEMARCATIÖN** (Fr. *démarcation*, from Lat. *de*, off, away, *ML. marca*, boundary, limit, mark), **LINE OF**. The historical and cartographical name given to an imaginary line running due north and south 100 leagues west of the Azores, established by a papal bull of Alexander VI on May 4, 1493, delimiting the spheres of Spanish and Portuguese possession in the New World. All new lands discovered east of this line were to belong to Portugal and all to the west to Spain. Dissatisfaction with this arrangement on the part of Portugal led to the conclusion of the Convention of Tordesillas between Spain and Portugal, June 7, 1494, sanctioned by a bull granted by Pope Julius II, Jan. 24, 1506, in which the line of demarcation was shifted 370 leagues west of the Cape Verde Islands, so that Brazil, as yet undiscovered,

subsequently fell to the share of Portugal. As between the two Iberian Powers, the terms of the convention were respected in fair measure, though disputes as to the exact determination of the line were frequent. The chief disputes were over the ownership of the Moluccas and Philippines, settled by the Treaty of Saragossa in 1529; and over the southwestern boundary of Brazil, which resulted in the abrogation of the line of demarcation and all agreements based thereon by a treaty of 1750. This treaty, however, was also abrogated in 1761 and all disputes involved were at length settled in 1779 by a new treaty. The other nations of Europe paid little regard to the papal bull. Consult Harris, *Diplomatic History of America* (New York, 1898), and Edward G. Bourne, *Essays in Historical Criticism* (ib., 1901).

**DEM'AREST'**, WILLIAM HENRY STEELE (1863- ). An American college president, born at Hudson, N. Y. After graduating from Rutgers College in 1883 and from New Brunswick (N. J.) Theological Seminary in 1888, he was ordained to the ministry of the Reformed church in America. He was pastor at Walden, N. Y. (1888-97) and at Catskill, N. Y. (1897-1901). In 1901-06 he was professor of church history at New Brunswick Theological Seminary, and in 1906 he became president of Rutgers College. He received the degree of LL.D. from Columbia University and Union College.

**DEMARTEAU**, de'mär'tô', GILLES (1722-76). A French line engraver. He was born in Liège, but studied and practiced his art in Paris. He is one of the most eminent exponents of the style of engraving in imitation of crayon drawing. He brought that process to great perfection, but was not, as is frequently stated, the inventor of it. For his services he received from Louis XV a pension of 600 livres, and in 1769 he was elected a member of the Paris Academy. His work comprises some 729 plates, for the most part after French masters, especially Boucher, including models for students, of which he seems to have created the typical academic style of drawing. Among the best are: "The Wounded Lycurgus," after Cochin, "Justice Protecting the Arts," after Cochin, "Entombment of Christ," after Stellaert; "The Education of Cupid" and "Venus Crowned," after Boucher; and some excellent portraits, especially that of the painter Charles Vanloo.

**DEM'AVEND'**, MOUNT. An extinct volcano of Persia, in lat 36° N., and long. 52° E., about 50 miles northeast of Teheran (Map: Persia, D 3). It has an altitude estimated at 18,500 feet and forms the loftiest peak of the Elburz chain, which separates the low shores of the Caspian Sea from the high table-land of Persia. Although no longer subject to eruptions, Demavend bears traces of comparatively recent activity. Its summit is conical and the crater still intact. At its base hot springs give evidence of the continued existence of volcanic heat at no great distance beneath the surface. A great deposit of sulphur covers the summit of Demavend and is brought down to the plains in bags as an article of commerce. The first European to make the ascent of Demavend was William T. Thomson, in 1837. Demavend towers high above the neighboring mountains, the adjacent summits not exceeding two-thirds of its elevation. At all times it has been a

conspicuous object from the great trade route between India and the West, along the edge of the Persian table-land. Zohak, a personification of the bad principle, was supposed by the Persians to be buried under Demavend.

**DEMEEA**, dém'-bē-a or dém-bē'-ā. See TZANA.  
**DEMBIN'SKI**, dém-ben'skē, HENRYK (1791-1864). A Polish and Hungarian general, born near Cracow, in Poland. He entered the Polish army in 1809, took part in the invasion of Russia by the French in 1812, and was made captain by Napoleon himself on the battlefield of Smolensk. He subsequently distinguished himself at Leipzig. After the fall of the Empire he returned to his native country and lived in comparative obscurity for some time. The Polish Revolution of 1830 called him again to arms. He obtained the command of a brigade of cavalry and exhibited heroic courage at the battles of Kuslev and Ostrolenka. Afterward he was engaged in the campaign in Lithuania and, returning to Warsaw, was made commander in chief of the national army, holding the post, however, for only three days. After the surrender of Warsaw to the Russians Dembinski went to France. In 1833 he proceeded to Egypt and entered the service of Mehemet Ali, but returned to Paris in 1835. Some months after the outbreak of the Hungarian insurrection Kossuth appointed him commander in chief of the main Hungarian army (Feb. 5, 1849). He drew up a line of campaign, but could not obtain the concurrence of Görgei, whose tardy arrival caused the loss of the battle of Kápolna (Feb. 26-27, 1849). Forced to retreat behind the Theiss, Dembinski resigned his command, but subsequently consented to act under Mészáros. He was appointed to the command of the Northern Hungarian army and strongly urged the necessity of uniting the cause of Hungary with that of Poland, proposing to lead an army into Galicia; but his advice was not taken. After the resignation of Kossuth, and the capitulation signed by Görgei at Világos (Aug. 13, 1849), Dembinski fled to Turkey. In 1850 he returned to France and began to write his *Mémoires* on the Hungarian war. He died in Paris in 1864. Consult Danzer, *Dembinski in Ungarn* (Vienna, 1873).

**DEME**, dém (Gk. δῆμος, *dēmos*, district). One of the primitive subdivisions of ancient Attica. The word originally meant "a country district" and was applied to the rural communities or to the people living in the country in distinction from those living in the city. The *demes* existed from an early period and, according to tradition, were made constituent parts of the Athenian territory by Theseus, but they do not become historically important until the time of Clisthenes (508-507 B.C.). When Clisthenes (q.v.) abolished, for all but religious purposes, the four old Attic tribes and substituted in their stead 10 new tribes, he first divided the people territorially into a certain number of *demes* and then formed his tribes by arbitrary groupings of these *demes*. (See **ATHENS**, *History*.) The *demes* were thus the fundamental political units of the state. The number of *demes* established by Clisthenes cannot be determined; the statement of Herodotus that he made 100 cannot be fitted into our other information concerning his reforms. The *demes* were variously named—some with gentile or patronymic names, some from the trades carried on in them, some from plants that

grew in the neighborhood, and so on. Each *deme* had its presiding officer (*δῆμαρχος*, *dēmarchos*), elected annually, its treasurer (*ταμίης*, *tamias*), its controller (*ἀντιγραφεύς*, *antigrapheus*), and other officers, besides its assembly, which, convened by the *demarch*, transacted the public business of the *deme*. There was also for each *deme* a register wherein were enrolled, for political and other purposes, all the members of that *deme*. Membership in the *deme* was hereditary; it was retained without regard to the place of actual residence. Consult: Hermann, *Griechische Alterthümer* (Freiburg, 1882); Leake, *Demes of Attica* (London, 1820); Haussouillier, *La vie municipale en Attique* (Paris, 1883); Wachsmuth, *Stadt Athen*, vol. ii (Leipzig, 1890).

**DE MENDOZA**. See SANTILJANA.

**DEMENTIA**. See INSANITY.

**DEMERARA**, dém'-rā'-rā. A river of British Guiana (q.v.), South America, rising in the mountains of the interior, flowing north almost parallel with the Essequibo, and emptying into the Atlantic at Georgetown (Map: Guiana, British, F 2). It is about 200 miles long, 1½ miles broad at its mouth, and navigable by ships of considerable burden for 75 miles. Its affluents are numerous, though small. At its entrance into the ocean it affords a spacious harbor, obstructed, however, by a bar.

**DEMESNE**, dé-mén', or **DEMAIN'** (OF. *de-maine*, *domaine*, 'from Lat. *dominium*, right of power). In the feudal system of land tenure, the dominion over land. But the dominion connoted by the term was the actual dominion of the freehold tenant, and not the theoretical dominion of the king or the mesne lord. It did not signify lordship of land, but the rights and the authority of the immediate owner. Such a tenant was said to hold "in his *demesne*" (*in dominio suo*). Blackstone distinguishes accurately between the allodial, or absolute, owner, outside the feudal system, who was described as holding the land "in his *demesne*," and the feudal tenant, whose dominion was qualified by adding the phrase "as of fee," indicating a real and yet subordinate dominion. But he was probably wrong in using the same term to describe the king's paramount lordship. The king, indeed, held lands in his *demesne*, there were and still are "*demesne lands*" of the crown, but they are the immediate property of the crown, owned and controlled by it, and not lands held of the crown by freehold tenants. See CROWN LANDS; FEUDALISM; TENURE.

*Ancient demesne* is a species of privileged copyhold tenure, surviving in a few ancient manors which formed part of the *demesne lands* of the crown in the time of the Conqueror and are so recorded in Domesday Book. These manors may now be in the hands of subjects. Tenure of ancient *demesne* is sometimes known as customary tenant right, privileged villenage, and villen socage. The abolition of the peculiar privileges which attended it, by statute in 1833, has assimilated it closely to ordinary socage tenure. Consult: Blackstone, *Commentaries on the Laws of England*; Vinogradoff, *Villénage in England*; Pollock and Maitland, *History of English Law* (2d ed., Cambridge and Boston, 1899). See COPYHOLD; SOCAGE.

**DEMETER**. See CERES.

**DEMETRIUS** (Gk. Δημήτριος, *Dēmétrios*). A sculptor of Attica, who flourished in the early part of the fourth century B.C. He was espe-

cially celebrated for the realism of his portraits, though some censured his excessively close imitation of natural defects. Consult E. A. Gardner, *A Handbook of Greek Sculpture* (London, 1911), and P. Gardner, *The Principles of Greek Art* (New York, 1914).

**DEMETRIUS**, called **PHALEREUS** (Gk. Δημήτριος Φαληρέας, *Demétrios Phaléreus*) (c.345–283 B.C.). A Greek orator and philosopher. He was born at Phalerum, Attica, and was a pupil of the philosopher Theophrastus. In 317 B.C. he was appointed Governor of Athens by Cassander (q.v.) and held that office successfully for 10 years. When Athens was taken by Demetrius Poliorcetes (q.v.) in 307 B.C., Demetrius Phalereus fled, first to Thebes, then to Ptolemy Lagus at Alexandria. Later he was banished from Alexandria and withdrew to Upper Egypt, where he died. Demetrius wrote many historical and philosophical works, but only fragments of these remain. The rhetorical treatise *On Style* (Περὶ Ῥημάτων, *Peri Herménēias*), ascribed to him, is probably a composition of a later date. The treatise was edited, with notes, Eng. trans., etc., by Roberts (Cambridge, 1902). The ancient critics all praise the suavity, elegance, polish, and subtlety of his speeches; yet his style was "effeminate, emotional without being inspiring, florid, tricked out with the spurious charms, the paints and dyes of a courtesan." Consult: Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der Griechischen Litteratur*, vol. ii (5th ed., Munich, 1911); the article "Demetrius" No. 85, in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. iv (Stuttgart, 1901).

**DEMETRIUS**. 1. A young Athenian in love with Hernia in Shakespeare's *Midsummer Night's Dream*. 2. The son of Tamora, Queen of the Goths, in Shakespeare's *Titus Andronicus*. 3. A friend of Antony in Shakespeare's *Antony and Cleopatra*. 4. Colia's princely lover in Fletcher's *The Humorous Lieutenant*.

**DEMETRIUS**. The assumed name of four pretenders to the throne of Russia between the years 1603 and 1613. In 1584 Ivan the Terrible died, leaving two sons, Feodor and Demetrius, the former of whom ascended the throne, but proved a weak ruler and fell completely under the control of his brother-in-law Boris Godunoff. The second son, Demetrius, was brought up at a distance from the court and when only 9 or 10 years old either was accidentally killed or was put to death. In 1598 Feodor died also, and Boris ascended the throne, but his tyrannical measures rendered him very unpopular. In 1603 a rumor spread through Russia that Demetrius was not dead, but had appeared in Poland. The fact was that a person calling himself Demetrius, but who, it is said, was in reality a monk named Gregory Otrepiëff, belonging to the convent of Tuhodov, had succeeded in persuading Prince Wisniewski in Lithuania, and afterward Mnisek, Palatine of Sandomir, that he was the true son of Ivan. The latter introduced him to Sigismund III, King of Poland, who saw in him a useful instrument for introducing Polish influence into Russia and so aided him in his designs against Boris. Towards the close of 1604 Demetrius, supported by a number of Polish nobles, invaded Russia, defeated Boris, who died in April, 1605, and entered Moscow in June, 1605, the people receiving him with great enthusiasm. He ruled for

some months with vigor and ability; but his manifest predilection for the Poles soon excited the Russians against him, and the arrival of his bride, Marina Mnisek, the daughter of the Palatine of Sandomir, with a Polish retinue on May 8, 1606, brought the discontent to a head. Eleven days later an insurrection broke out in the capital, headed by Prince Vasilii Shuiski. The pretender was slain, and a multitude of the Poles massacred. Vasilii Shuiski now ascended the throne; but in 1607 an individual appeared alleging that he was Demetrius and that another had been mistaken for him in the Moscow massacre. He found a considerable number of adherents, and Marina acknowledged him to be her husband. The Poles helped him, and for some time it seemed likely that he would succeed; but at length he was killed at Kaluga in 1610. The third pretender gave himself out to be the son of the first. After a brief career he fell into the power of the Czar and was strangled. The fourth made the same pretensions, but, falling into the hands of the Cossacks, was carried to Moscow, where he was executed in 1613. Consult: Scipkin, "Wer war pseudo-Demetrius I," *Archiv für slavische Philologie*, vol. v (Berlin, 1898, 1900); Munro, *The Rise of the Russian Empire* (London, 1900); Kostomarov, *Les faux Dmitri* (St. Petersburg, 1864); Merimée, *Les faux Demetrius* (Paris, 1858); Eng. trans. by A. R. Scoble.

**DEMETRIUS I**, called **POLIORCETES** (Δημήτριος Πολιορκητής, *Demétrios Poliorcētēs*, "Demetrius, Besieger of Cities") (c.337–283 B.C.). A king of Macedonia. He was the son of Antigonos Cyclops and Stratonice. At an early age he assisted his father in wars with the generals of Alexander, was defeated by Ptolemy, the son of Ptolemy Lagus, at Gaza in 312, but soon after retrieved his fortunes by gaining a victory over Cillex in Syria. In 307 he freed Athens from the rule of Cassander (q.v.), expelled the garrison under command of Demetrius Phalereus (q.v.), and was received in the city with divine honors. In 306 he defeated Ptolemy in a naval battle at Cyprus and destroyed the naval power of Egypt. In 305 he laid siege to Rhodes, but was unable to take the city. Afterward (301) he won the enmity of Seleucus, Cassander, and Lysimachus; he was defeated at Ipsus by Seleucus and Lysimachus. His power in Greece now passed from him for a time, but in 295 he recovered Ægina, Salamis, and Athens. In 294 he murdered Alexander, brother of Antipater, and seized the throne of Macedonia, but was afterward expelled by Pyrrhus and finally surrendered to Seleucus (286), whose prisoner he remained until his death (283). Demetrius is famous for having conducted his sieges on a grand scale, with all the paraphernalia known to the military science of that age. His ingenuity in devising new siege weapons was shown especially in his attack on Rhodes. His life was written by Plutarch.

**DEMETRIUS I**, called **SOTER** (Gk. Δημήτριος Σωτήρ, *Demétrios Sōtēr*) (c.187–150 B.C.). King of Syria from 162 to 150 B.C. He was the son of Seleucus IV Philopator and lived at Rome as a hostage during the reign of his father and that of Antiochus Epiphanes, who had usurped the throne, after the death of Philopator (175). He escaped from confinement in 163, overthrew and killed Antiochus V Eupator, and, with the aid of the Romans, established himself firmly in power. He carried on war against the Jews

and the Cappadocians and freed the Babylonians from the rule of the satrap Timarchus and so won the title of Soter, "Savior." He fought with the Maccabees. He fell in battle against the usurper Alexander Balas.

**DEMETRIUS II.** A king of Macedonia (c.230-229 B.C.). He was the son of Antigonus Gonatas (q.v.) and grandson of Demetrius Philorretes (q.v.) and was engaged in continual warfare with the peoples to the north of Macedonia and with the Achaean and the Aetolian leagues.

**DEMETRIUS II, NICATOR** (?-c.125 B.C.). A king of Syria, son of Demetrius Soter (q.v.). After his father's death he lived many years in exile, but with the assistance of Ptolemy Philometer, whose daughter he married, he secured the throne of Syria in 146 B.C. About 138, in an expedition against the Parthians, he was defeated and taken prisoner. After 10 years of captivity he was restored to power (c.128), but was vanquished by a pretender to his throne in a battle near Damascus. He fled to Tyre and there perished by assassination.

**DEMETRIUS III**, variously known as EUCERETUS, EVERGETES, and PHILOMETOR, King of Syria from 94 to 88 B.C. He was the grandson of Demetrius Nicator and ruled jointly with his brother Philip, but was dethroned by him, with the aid of the Arabs and the Parthians, and died a prisoner among the Parthians.

**DEMETRIUS OF BYZANTIUM**, *bi-zăn'-shi-ŭm*. A Peripatetic philosopher. He is supposed to have been the man who tried to dissuade Cato Uticensis from suicide. Part of his book *On Poets* is quoted by Athenæus and Philodemus. Parts of book ii of this work have been recovered at Herculaneum. Consult Scott, *Fragmenta Herculaneus* (Oxford, 1886).

**DEMETRIUS OF SURIUM**. A cynic philosopher, who lived in Rome for the greater part of the years 40 to 80 A.D. He enjoyed the friendship of Seneca, who observes that Nature made him to be at once an example and a reproach to the world. (Consult *De Beneficiis*, vii, 8, 2.) He was a consistent opponent of the monarchy. He refused an offer of a large sum by Caligula, meant to win him from his opposition.

**DEMETRIUS TRICLINUS** (Lat., from Gk. *Δημήτριος Τρικλίνος*, *Dēmétrios Triklínos*). A Greek scholiast of the fifteenth century. In addition to his recension of the text of Sophocles, which served as the basis of several subsequent revisions, he composed scholia on the same poet, and on Hesiod, Pindar, and Aristophanes, and works on the metres and figures of Sophocles.

**DEMETRIUS ZENUS** (Lat., from Gk. *Δημήτριος Ζήνος*, *Dēmétrios Zénos*). A writer of Zacynthus, who lived in the sixteenth century. His works include a translation of the *Batrachomyomachia* (about 1530) into modern Greek in the *στίχοι πολιτικοί*, *stíchoi politíkoí*, or popular verses, and a poem in the same measure on Alexander the Great (printed at Venice, 1829). The former work has been edited by Müllach (Berlin, 1837). It was printed, with a Latin translation, by M. Crusius, in Igen's edition of the *Homeric Hymns* (Halle, 1796).

**DEMETZ**, *de-mätz*, FRÉDÉRIC AUGUSTE (1796-1873). A French prison reformer, born in Paris. He studied law and was subsequently made a judge. In 1836 he was sent by the French government to the United States for the purpose of studying American penitentiaries.

The results of his investigations were published in 1839 under the title *Rapports à Monsieur le comte de Montalivet sur les pénitenciers des États-Unis*. One of the conclusions of this report is that the penitentiaries of Pennsylvania, organized on the plan of isolating the young prisoners, were inefficient. Demetz's chief services, however, were in connection with a reformatory founded by him in 1840 on an entirely novel plan at Mettray, near Tours. Hundreds of young criminals were gathered by him into this reformatory at the expiration of their terms of imprisonment, and there they were given instruction and agricultural work which entitled them to moderate compensation. The results thus achieved led to the introduction of this system in several other European countries.

**DEMI'**, or **DEMY** (Fr. *demi*, Lat. *dimidius*, half). A term in heraldry. An animal is said to be demi when only the upper or fore half of it is represented. In inanimate objects the dexter half per pale is usually intended, when it is said to be demi, though a demi fleur-de-lis, e.g., may be a fleur-de-lis divided per fess.

**DEMICAN'NON**. A large gun used in the sixteenth and seventeenth centuries and perhaps later. It is said to have had a length of 12 to 14 feet, a diameter of bore of 6½ inches, and to have fired a ball of 33 pounds weight. There is some doubt about this, as a solid spherical shot for a 6½-inch gun ought to weigh over 40 pounds. The point-blank range was estimated at 162 paces and its range at 2000. See GUNS, NAVAL.

**DEMICUL'VERIN**. A gun of about the same date as the demicannon (q.v.). It was about 9 feet long, had a bore of about 4.5 inches, and threw a ball of nine pounds weight. Its point-blank range was about 174 paces and its range 1800. See ARTILLERY; ORDNANCE.

**DEMIDOFF**, *dye-mé'dóf*, Princes of San Donato. A noble and wealthy Russian family, the most distinguished members of which are: 1. NIKITA DEMIDOFF (c.1665-c.1720), the founder of the family, a runaway serf, who amassed an immense fortune as a manufacturer of arms. He established numerous forges and foundries in the Urals and died after 1720. 2. AKINF DEMIDOFF (died c.1740), son of Nikita, brought over skilled German miners to examine the rich deposits of gold, silver, and copper in the river valleys of Siberia. The government made him a councillor of state. 3. PROKOP (1710-1786), son of Akinfi, established a commercial school in Moscow in 1772. 4. PAUL DEMIDOFF (1738-1821), cousin of Prokop, traveler and scientist, gave a museum of natural history to the University of Moscow and founded the Demidoff Museum of Yaroslavl. 5. NIKOLAI, COUNT DEMIDOFF (1773-1828), nephew of Paul, married the Countess Strogonoff and became a privy counselor and Imperial chamberlain. He distinguished himself in the war against the Turks. In 1812 he raised a regiment and fought at its head against Napoleon. 6. ANATOLE (1812-70), son of Nikolai, displayed great enthusiasm for letters and the sciences. His principal book, published in Paris in 1839, entitled *Travels in Southern Russia and Crimea*, is the record of a great scientific expedition undertaken at his expense. In 1841 he married Mathilde de Montfort, daughter of Jerome Bonaparte. The marriage was dissolved by mutual consent in 1846. Hospitals, schools, and

museums all over Russia testify to the munificence of the Demidoffs.

**DE MILLE**, dé-mil', HENRY CHURCHILL (1850-93). An American playwright, one of the authors of *The Wife*, *Lord Chumley*, and other pieces. He was born in North Carolina and educated at Columbia College, from which he was graduated in 1875. In 1882 he became examiner of plays at the Madison Square Theatre, and later he was an actor under A. M. Palmer's management. His first play, *Delmar's Daughter*, was produced in 1883 without success. In 1884 he produced *The Main Line*, by himself and Charles Barnard. In collaboration with David Belasco he wrote *The Wife* (produced in 1887 at the Lyceum), which proved a great success, and in the following seasons they brought out *Lord Chumley*, *The Charity Ball*, and *Men and Women*. In 1891 he adapted from the German *The Lost Paradise*. Consult Montrose J. Moses, *The American Dramatist* (Boston, 1911).

**DE MILLE**, JAMES (1833-80). A Canadian author, born at St John, New Brunswick. He graduated at Brown University in 1854, was professor of classics in Acadia College (Wolfville, Nova Scotia) in 1860-65, and from 1865 until his death occupied the chair of history and rhetoric in Dalhousie College (Halifax, Nova Scotia). De Mille wrote more than 30 novels, of which the best are *Helena's Household* (1868), a Roman tale of the first century, and *A Strange Manuscript Found in a Copper Cylinder* (1888), posthumously published. *The Dodge Club* (2 vols., 1866-69) is a humorous book of travel. His other publications include *Andy O'Hara* (1860); *The Soldier and the Spy* (1865); *The American Baron* (1870); *The Lady of the Ice* (1870); *Comedy of Terrors* (1872); *The Living Link* (1874); *The Winged Lion* (1877, 2d ed., 1904); *A Castle in Spain* (1882-83). *A Treatise on Rhetoric* (1878).

**DE MILLE**, WILLIAM CHURCHILL (1878-). An American playwright, born at Washington, N. C. He graduated from Columbia University in 1900 and studied also at the American Academy of Dramatic Arts in New York City. He is co-author of the following plays: *The Genius* (1906), *Classmates* (1907), *The Royal Mounted* (1908), and is author of *Strangheart* (1905), *The Warrens of Virginia* (1907), *The Land of the Free*, and *The Woman*, which was novelized by Albert Payson Terhune in 1912.

**DEMIMONDE**, dém'i-mönd or de-mé'mönd' (Fr., half world). The better class of courtesans in Paris and other cities. The term originated with Alexandre Dumas fils, who used it in the phrase meaning "half-and-half society."

**DEMING**. A village and the county seat of Luna Co., N. Mex., 86 miles northwest of El Paso, Tex., on the Southern Pacific, the Atchison, Topeka, and Santa Fe, and the El Paso and Southwestern railroads, and on the Mimbres River (Map. New Mexico, B 6). It is a health resort, contains a hospital, and has important commercial interests, being the trade centre of a cattle and wool growing and mining region. Settled about 1881 and incorporated in 1901, it is governed under a charter of the latter date by a mayor, elected for a term of three years, and a unicameral council. Pop., 1910, 1864.

**DEMING**, CLARENCE (1848-1913). An American editor, born at Litchfield, Conn. Gradu-

ating from Yale University in 1872, he served as assistant editor of the *Troy Whig* (1872-73), as night editor of the New Haven *Palladium* (1874-75), and as assistant news editor, editorial writer, and traveling correspondent for the New York *Evening Post* (1875-84). For several years he edited the New Haven *News* and later he was associate editor and editorial writer for the *Railroad Gazette* (now *Railway Age Gazette*). Besides magazine articles, he is author of *By-Ways of Nature and Life* (1884).

**DEMISE'** (OF, fem. of *demis*, from Lat. *demittere*, to hand down). In the most general sense, a transfer or conveyance of an interest in land. Technically the term is employed in two distinct senses: first, to denote a lease or letting of land for a term of years; second, to describe the transmission of the royal authority, dignity, and estates from one sovereign to his successor. The phrase "demise of the crown" does not signify the death of the sovereign, but the transfer or devolution of the kingdom, whether that occurs as the result of the death or of the voluntary abdication of the sovereign. Probably, however, it would be restricted to the case of a normal transfer of the crown in the succession established by law, and not to a change in the succession by revolution or otherwise. However this may be, the phrase "demise of the crown" is the legal expression of the notion involved in the popular phrase "The king never dies." It indicates that the government does not come to a full stop on the death or abdication of its head, but that the royal authority is continuous and permanent, passing at once, without a break or jar, to him who is to exercise it next. This conception of the matter, so important to the welfare of the kingdom and the stability of the government, is comparatively modern, the effect of the death of the sovereign in England having formerly been to paralyze for the time being many of the functions of government, including the administration of justice. The King's Peace had to be proclaimed anew by each sovereign at his accession, and the administration of government newly constituted. All these inconveniences have been remedied by a series of statutes enacted since the accession of William and Mary, and the principle of the immediate demise of the crown, as above described, firmly established. See Anson, *Law and Custom of the Constitution* (2d ed., Oxford, 1896).

**DEMIURGE**, dém'i-ürj or dé'mi- (Lat. *demurgus*, from Gk. *δημιουργός*, *dēmourgós*, handicraftsman, from *δημος*, *dēmos*, of the people + *εργον*, *ergon*, to work). The name given in the cosmogony of the Gnostics to the creator of the world of matter and sense. He was variously conceived. In general, he was the archon or chief of the lowest order of the spirits or eons of the pleroma, mingling with chaos, he formed in it a corporeal animated world. He created man, but could impart to him only his own weak principle, the *psyche*, or sensuous soul; therefore the highest, the really good God, added the divine rational soul or *pneuma*. But the power of evil in the material body prevented the development of that higher element. The demiurge, ignorant of the highest God, could not bring his creatures to the knowledge of the true Godhead; as the Jehovah of the Jews he gave them the imperfect law of Moses, which promised merely a sensuous happiness, and even that not attainable; so that another revelation

was necessary. Christian Gnosticism usually held Christ to be the bearer of that revelation, and the opponent of the claims of the demiurge upon men. See Gnosticism.

**DEMMIN**, dê-mên' (formerly *Dymin*, *Demyn*, *Dammyn*, *Timin*, from OChurch Slav. *dymŭ*, smoke, Lat. *funus*, Skt. *dhūma*, vapor). A town of the Prussian Province of Pomerania, situated on the navigable Peene, 72 miles west-northwest of Stettin (Map. German Empire, E 2). Besides the town proper, Demmin comprises three suburbs. There are manufactures of machinery, woollens, hats, sugar, bricks, and leather. It has also distilleries and breweries, iron foundries, fisheries, and a large trade in lumber and grain. Pop., 1900, 12,085; 1905, 12,541, 1910, 12,378. Demmin, which had its origin in a Slavic settlement, was in the ninth century a place of some commercial importance. In 1164 it was taken by Henry the Lion, and in 1238 it became a member of the Hanseatic League. By the Peace of Westphalia it passed to Sweden, and in 1720 it came into the possession of Prussia.

**DEMMIN**, ANGUST (1823-98). A German-French art critic, born in Berlin. He went to Paris at the age of 17 to complete his education and made his home there until 1872, but traveled extensively throughout Europe and in Asia in pursuit of his studies, especially in the fields of ceramics and the science of arms. In 1873 he removed to Wiesbaden. The most important of his works is *Encyclopédie historique, archéologique, etc., des beaux-arts plastiques* (1872-80, 5 vols., with 6000 illustrations). He wrote also a series of manuals, both in German and French, designed to guide the amateur of the decorative arts, besides comedies, dramas, and novels.

**DEMMLER**, dêm'lér. GEORG ADOLF (1804-86). A German architect and politician. He was born at Güstrow, Mecklenburg, studied at the University and at the Academy of Architecture in Berlin, and in 1824 entered the government service of Mecklenburg. Appointed court architect in 1837, he planned the Grand Ducal Palace, the Court Theatre, and the Arsenal. Much interested in the welfare of the workmen, he introduced a system by which they shared directly in the profits of their labor. His political activity in 1848-50 led to his dismissal from the government service in 1851. He traveled for several years in Europe. He was one of the founders of the National Association (Nationalverein), in 1859, of the League for the Promotion of Peace and Liberty, and in 1868 joined the so-called German People's Party at Stuttgart. He was elected by the Social Democrats to the Reichstag in 1877, but did not seek reelection.

**DEMOCÉDES** (Gk. *Δημοκῆδης*, *Dēmokídēs*). One of the most famous of the early Greek physicians. He was born at Crotona, in lower Italy, about the middle of the sixth century B.C. After living at Ægina, Athens, and Samos, as official physician of the commonwealth, or of Polycrates (q.v.), retained at a high salary, he was taken prisoner by the Persians and carried to the Persian court, where he rendered important medical assistance to Darius I and his wife Atossa. Though honored by the Persians, he was desirous of returning to his native city; and, through the favor of Queen Atossa, he secured appointment to a secret mission which was sent to Greece. Escaping on this

expedition, he returned to Crotona. There he championed the aristocratic party and was obliged to flee to Platea. Consult Herodotus, iii, 129-138 (a narrative not in all respects historical).

**DEMOCARES**, dê-môk'a-réz (Lat., from Gk. *Δημοκάρης*). An Athenian orator and statesman, nephew of Demosthenes. He began his public career as leader of the anti-Macedonian party (322 B.C.) and, after the restoration of the democracy in Athens (307), became head of the patriotic party. He was exiled about 295, but returned in 287 or 286, after which he acted as Minister of Finance. He died after 280. Democares left orations and an elaborate history of his time, only fragments of which remain; for these consult Müller, *Fragmenta Historicorum Græcorum*, ii, 445-449. Consult Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i (5th ed., Munich, 1908).

**DEMOCLES** (Lat., from Gk. *Δημόκλης*, *Dēmoclēs*). An Attic orator of the school of Theophrastus, a contemporary and opponent of Demosthenes. He is known best as the defender of the children of the orator Lycurgus against the calumnies of Mirocles and Menæcechmus. Though none of his works is extant, he probably left some written orations, since Dionysius of Halicarnassus ascribes to him an oration which had been attributed to Dinarchus. Dionysius and Suidas call him Democles.

**DEMOCRACY** (Gk. *δημοκρατία*, *demokratia*, government of the people, from *dēmos*, *dēmos*, the people + *araiō*, *kratō*, to rule). A term of wide and variable signification, comprehending such diverse but related conceptions as (1) a society based on equality, (2) a state in which the actual power of government is lodged in the mass of the people; and (3) a form of governmental organization in which the authority of the state is directly administered by the people or their chosen representatives. The term is also often employed indefinitely to describe all of these taken together, in which case it may be defined as a form of society in which the social organization, the energy of the state, and the powers of government are directed and controlled by the mass of the people, and sometimes more vaguely to characterize the tendency of the progressive nations during the last 200 years towards the realization of such a social and political organization. It is in the first, or social, sense that the term "democracy" is most frequently employed by continental and especially French writers, and in the third or governmental sense by the Greek philosophers, while among English and American political writers, from Bentham to Lecky and Woodrow Wilson, the tendency has been to limit its use to the actual exercise of political power by the people, and therefore as coextensive in meaning with popular government.

A democratic society is one in which privilege, whether based on birth, on wealth, or on public service, has been abolished, and a substantial equality of legal rights and obligations and of social and industrial opportunity established. The existence of a caste, whether hereditary or intellectual, or of social classes is incompatible with a democratic organization of society, which is likewise menaced by the growth of centralization of wealth on the one hand, and, on the other, by the existence of extreme poverty and the growth of dependent classes. It can therefore, under the present industrial system, be

only imperfectly realized in a state of civilization, its best illustrations being found in primitive or simple communities, like certain of the Swiss cantons and the frontier settlements in the western portions of the United States and Canada. Democracy as a social principle rests upon the doctrine of the essential equality of all men and of their equal worthiness—a notion derived mediately from the Christian conception of the equality of all men before God, but owing its translation from religion to society and politics chiefly to the influence exercised by the writings of Jean Jacques Rousseau. In the form which he gave to it, and in which it claims our allegiance, the doctrine and the practice of it are wholly modern. Certainly there was no social equality in the "état de nature," in which Rousseau imagined himself to have found it, and the so-called democracies of the ancient world were anything but democratic in sentiment or in social structure. The triumph of the principle in the modern world has been checked by the unexpected persistence of the military spirit and the revival of militarism in Europe during the latter half of the nineteenth century, and by the wonderful industrial expansion of the same period, with the consequent increase and unequal distribution of wealth, in both Europe and America.

A government democratic or popular in form is a republic—i.e., a government in which the administration of the affairs of the state is committed to the people, to be exercised by them either directly in popular assemblies, like those of the Athenian democracy, or indirectly through representatives chosen by them, as in the republics of the modern world. Of this it may be observed, first, that the pure or direct form of democratic government, at which the criticisms of Greek political writers were directed, has never been completely realized and cannot be completely realized in practice. Certain of the functions of government must always be delegated. If the legislative power be exercised by the whole body of citizens, and the judicial power by large bodies of citizens chosen by lot or acting in turn, the executive power must always in fact be committed for longer or shorter periods to chosen representatives of the popular will. In the second place, even in this limited form, the direct form of democratic government is possible only in small and compact states, like the smaller Swiss cantons and the city states of antiquity; and even in these it has usually been found to be operative only on the undemocratic principle of rigidly limiting the number of citizens entitled to participate in the government. The town-meeting plan of government cannot be extended to the great aggregates of people which constitute modern states. In the third place, it is to be observed that, though the democratic state tends to act through republican forms, a representative republic is not necessarily democratic either in spirit or in its actual operation. A government republican in form may, like that of France, be essentially bureaucratic in structure and effect; or be, like that of the most of the Spanish-American states, a military tyranny; or be, like that of Mexico under Diaz, a virtual despotism. No one of these can properly be termed a democracy, though that designation would not be denied to England, which is a monarchy in form, or to Canada, which is a subordinate part of an empire. It would seem,

therefore, that the term "democracy" is not properly used to describe the external form of government, but rather a type of political society in which the essential power of the state is wielded by the mass of the people.

As thus understood, the true antithesis of democracy is not monarchy or oligarchy, but absolutism, i.e., dominion exercised over the mass of the people by an individual or a group of individuals, however constituted, not responsible to the people nor bound by law or custom to consult their wishes. Democracy, on the other hand, is popular government—government actually directed and controlled by the people, under whatever constitutional forms. The terms "monarchy," "oligarchy," and "republic" properly describe the form, and not the essential character of a government. A democracy may exist under any one of these forms. A limited monarchy, like that of England, under which the power of the state is actually exercised by the people through their chosen representatives, may be more truly democratic than a republic, like the recent government of the Transvaal, in which the actual power is wielded by a financial or political oligarchy, or like the Athenian Republic, in which it is restricted to a small minority of the male inhabitants of the state.

Attention has been called to the fact that democracy as a social principle is of modern origin. This explains the curious differences between the ancient and the modern conceptions of political democracy. The Aristotelian notion of democracy as a community of free citizens ruling the state, not being based on any conception of the essential equality of all men, was not offended by the existence in the state of a numerous laboring class, servile or free, and of a large resident alien population, which together outnumbered the political citizens 10 to 1, and which were equally excluded from participation in the government. The modern idea of a political democracy, on the other hand, being derived from the social conception of the equal worth of all members of the state, is satisfied with nothing less than the substantial participation of the great body of the people in the affairs of the state. It rests upon the theory that the people, whose welfare is the true end of government, are better judges of what will conduce to their welfare than is any individual or group of individuals likely to arise by any hereditary or self-selective process—a sound and salutary doctrine, which, however, in political experience runs too easily into the extreme form of the assertion that for public purposes one man's opinion is as good as that of any other man, and that all men are entitled to equal weight in political affairs.

It is to England more than to any other nation, even than the United States, that the modern world owes the realization of the democratic ideal in forms of political action. The two great revolutions—that which resulted in the creation of the Commonwealth, and that which finally expelled the Stuarts—were essentially popular in character. Though the Parliament was throughout that period, and until the reforms of 1832 and 1867, an aristocratic body, its responsiveness to public opinion and its steadfast resistance to royal pretensions made it the type of a popular representative assembly in Europe. Before the middle of the nineteenth

century every considerable European state, with the exception of Russia and Turkey, had adopted a constitution limiting the power of the crown and vesting a considerable share of political power in the people, and in most of them a representative legislature of the parliamentary or British type was adopted. But nowhere on the Continent, excepting in France, Switzerland, Norway, and Sweden, has popular government reached a high degree of efficiency or attained any considerable measure of success. Even in England the complete triumph of the democratic principle has been delayed, both in politics and society, by the persistence of the aristocratic tradition, which still preserves a considerable number of legal rights and privileges to a social class based on birth and inherited wealth, and which gives that class a preponderating influence in the political organization of the state.

Democracy in the United States is historically the offspring of the democratic forces in English political institutions. The radical wing of English republicanism and Whiggery in the seventeenth and eighteenth centuries dominated the settlement of the English Colonies in America and dictated their political development. The simplicity of Colonial life and the absence of any considerable representative of the English aristocratic classes promoted the orderly growth of a homogeneous democracy, which stood clearly revealed when the shock of separation from the mother country came. The speedy adoption of a written constitution, however, fixed the forms of American democracy and in so far tends to control the evolution of its ideals. The result is that in most forms of political action the United States is now less democratic than Great Britain. In spirit the English democracy is doubtless more conservative than that of the United States.

Since the opening of the new century there has been a marked revival of the democratic spirit in western Europe and America and the birth of that spirit in the older civilizations in which society had for centuries been unresponsive to its influence. The unrest which has recently characterized the teeming millions of India, the recent revolution in China and the Young Turkish movement in Turkey, as well as the widespread demand for woman suffrage in Europe and the United States, indicate that the movement is world-wide. The transformation, still in progress, of the Liberal party in Great Britain into a radical party, the rapid success of the so-called progressive movement in the United States, and the growth of Socialism and the Socialist party in western Europe and the United States are marked instances of its success. The demand for the direct nomination of candidates for public office, for the direct election of United States senators (secured by recent amendment to the Federal Constitution), and for such political safeguards as "the initiative," "the referendum," and "the recall," are further indications of its purpose and strength. In the social, as distinguished from the political, sphere the democratic movement of the time is finding forcible expression in the feminist movement and in various important legislative devices to improve the condition of the working classes and the poor. See CONSTITUTION; GOVERNMENT; REPUBLIC; FEMINISM; EQUAL SUFFRAGE; SOCIAL LEGISLATION; SOCIALISM.

Most of the philosophical authorities are hos-

tile critics of democratic government. For the ancient and medieval view, consult Dunning, *History of Political Theories, Ancient and Mediæval* (New York, 1902); for the modern view, consult: De Toqueville, *Democracy in America* (1835); Motley, *Historic Progress of American Democracy* (1869); Freeman, *Comparative Politics* (London, 1873); Maine, *Popular Government* (ib., 1885); Bryce, *The American Commonwealth* (new ed., London and New York, 1910); Lecky, *Democracy and Liberty* (London, 1896); Burgess, *Political Science and Constitutional Law* (Boston, 1891); Wilson, *The State: Elements of Historical and Practical Politics* (ib., 1892); Ostrogorski, *Democracy and the Organization of Political Parties* (2 vols., New York, 1902).

**DEMOCRATES** (Lat., from Gk. *δημοκράτης*, *Dēmokratēs*). An Attic orator who lived about 350 B.C., a contemporary of Demosthenes and an opponent of the Macedonian party. He accompanied Demosthenes to Philip to receive the latter's oath to the treaty with Athens and afterward assisted him in concluding a treaty against Philip with the Thebans. As an orator he was of only secondary importance.

**DEMOCRATIC PARTY.** The term "Democratic," as used in American party politics, was occasionally and loosely applied in the years 1789-92 to the group of Anti-Federalists (q.v.), and thereafter, in the last decade of the eighteenth century and the first two decades of the nineteenth, to the party then commonly known as the Republican. The vigorous adoption by these Anti-Federalist Republicans, especially during Washington's administration, of French principles and sympathies led to the application to them of the term "Democratic Republican," which remained in quite common usage for more than 30 years. This general attitude was one of opposition to all centralizing tendencies in the interpretation of the Federal Constitution. They wished the national government to remain weak, somewhat as it had been under the old Confederation; and they regarded the States as sovereign in an extreme sense of that word. (See STRICT CONSTRUCTIONISTS.) Upon the disappearance of the Federalist party (q.v.) there gradually appeared within the only party then active two groups, one of which became known as the National Republicans, and the other of which retained the old name of Democratic Republicans. The former developed into the Whig party (q.v.), while the latter was compactly organized as the Democratic party, which has since 1828 maintained an unbroken existence. This party, when thus organized by Jackson, adhered to the orthodox tenets of the old Anti-Federalists, the strict construction of the Constitution, and the limitation of the powers of the Federal government. As slavery, however, soon became the most vital question in national politics, and as the Democratic party was largely controlled by its Southern wing, it became finally the party of conservatism, in opposition to the new Republican party's progressive platform of free men and free soil. The two sectional wings of this party became naturally separated during the course of the Civil War, and the subsequent process of rehabilitation was so prolonged that the party was not again able to elect a president (leaving out of account the disputed election of 1876) until 1884, when entirely new issues were involved. In its later course the

party, in accordance with its old traditions, became particularly conspicuous as the advocate of tariff reform, and upon that platform its first post-bellum President, Grover Cleveland, was elected.

The founding of the present Democratic party, although in large measure due to the bitter fight between the followers of John Quincy Adams and those of Andrew Jackson, occurred in a decade during which were effected certain significant changes in the American political system. Thus, the practice, which had been hitherto uniformly observed, of having the presidential electors chosen by the State legislatures, was in some States abandoned, and thereafter the present method, by which the voters at large were given a share in the choice of the electors, was gradually introduced. Moreover, the old method of leaving the choice of presidential candidates to a caucus (q.v.) of the members of a party in Congress was vigorously attacked in 1824, with the result that after 1828 the people at large, through the medium of the national nominating conventions, had a direct share in the choice of candidates. Furthermore, in the same decade was felt for the first time the real significance of the political power of the new States beyond the Alleghenies; for, with the rise to power of the new Jacksonian democracy, there was given full sway to the principles of equality and of thorough democracy, which were best illustrated in the region of which Jackson was the natural product. In large measure the first conflict, in addition to being a largely personal one between the followers of Adams and those of Jackson, became a struggle between the old aristocracy of the East and the new democracy of the West, in which the latter, having almost won in the campaign of 1824, triumphed decisively in 1828, and brought to the presidency the man who in eight years was to transform a personal following into a dominating national party. Jackson brought under his leadership not only the friends of Calhoun and of W. H. Crawford, but also the strong forces of the Albany Regency (q.v.), under the lead of his Secretary of State, Martin Van Buren. Accordingly the Democratic convention—the first national convention of the party—which met at Baltimore, May 21, 1832, had little more to do than to name a candidate for the vice presidency, and in that step they followed the will of their leader and named Van Buren. This convention originated the so-called "two-thirds rule." The election which followed indicated clearly that Jackson's policy as to the tariff and as to the national bank had been approved, inasmuch as he received 219 electoral votes, while Henry Clay received only 49, Jackson carrying besides the Southern States, excepting Kentucky, the States of Maine, New Jersey, New Hampshire, and New York. The next convention of the party, that at Baltimore on May 20, 1835, was peculiar in having some 626 delegates, of whom 422 came from four States, Maryland, e.g., sending as delegates every member of the State Democratic convention. As was commonly expected, Van Buren was given the nomination, Richard M. Johnson, of Kentucky, being named for the vice presidency. The vote of the Whig candidate, William H. Harrison (q.v.), was increased to 73, while Van Buren's electoral vote fell to 170, a part of this Democratic weakening being accounted for by the

26 votes which were cast for Judge White, of Tennessee, and the 11 votes which were cast for Mangum by South Carolina. The whole responsibility for the failure of the financial policy of Jackson and Van Buren was placed upon the Democratic party, with the result that in 1840 General Harrison received 234 electoral votes and Van Buren received only 60. The Democratic convention of May 4, 1840, had been especially uncertain in its action because of a pronounced difference of opinions as to the claims of Vice President R. M. Johnson. The convention adopted, in a series of resolutions, what was substantially a "platform," expressing their view of the limited authority of the central government and of the impropriety of Federal laws establishing a national bank, providing for internal improvements, or fostering particular industries. The same platform, with additions, was adopted by the convention held at Baltimore on May 27, 1844, which pronounced for the reoccupation of Oregon and the annexation of Texas. For the first time in a convention of the party there was then a serious contest for the presidential nomination. Upon the first ballot Van Buren received a majority of the votes, and, although in the lead for four ballots, for the four subsequent ballots the leading candidate was General Cass, of Michigan; but on the ninth ballot the convention was "stampeded" for an inconspicuous candidate, possibly advanced to preserve harmony, James K. Polk, of Tennessee. George M. Dallas, of Pennsylvania, was nominated for the vice presidency, and this ticket received 170 electoral votes, as against 105 votes cast for Henry Clay. The failure of Van Buren to secure the party's nomination in 1844 and the choice by Polk of William L. Marcy (q.v.) of New York, as his Secretary of State, brought into prominence the factional controversy between the "Barnburners" (q.v.) and the "Hunkers" (q.v.) in New York. Both of these factions sent delegations to the convention of May 22, 1848, at Baltimore, and both delegations were admitted to seats, the vote of the State being divided equally between them. Neither delegation took thereafter any part in the convention, although the Hunkers and Marcy supported the administration and the party's nominee. On the fourth ballot Gen. Lewis Cass, of Michigan, was nominated for the presidency, and for the vice presidency Gen. William O. Butler, of Kentucky, was named, the convention also readopting substantially the platform of 1844. The seceding Barnburners held a State convention in June, in which delegates from four other States were present, and nominated Van Buren for the presidency, and in August they took part in the national convention of the Free Soil party at Buffalo, which nominated their leader for the presidency and Charles Francis Adams for the vice presidency. This combination of "Free-Soilers" and Barnburners effected such a division of the Democratic vote in New York that Taylor carried the State and secured in the aggregate 163 electoral votes, while Cass received 127. Between 1848 and 1852 political conditions were materially changed, particularly through the progress of events attending the Compromise Measures of 1850 (q.v.), and also through the effect upon the Whig party of the differences between the "Conscience" Whigs and the "Cotton" Whigs. At the Baltimore convention of June 1, 1852,

Cass, Buchanan, and Douglas were prominent candidates, but on the forty-ninth ballot Franklin Pierce, of New Hampshire, was named. William R. King, of Alabama, being nominated for the vice presidency. The platform was similar to that of 1848, with the addition of the "finality" plank, with an approval of the doctrines of the Virginia and Kentucky Resolutions (q.v.), and with a declaration of the justness of the war against Mexico. The Free-Soilers nominated John P. Hale (q.v.), of New Hampshire, while the Whigs, for what was the last campaign of the party, nominated Gen. Winfield Scott (q.v.), who received only 42 electoral votes, as against 254 cast for Pierce. In the convention of June 2, 1856, Pierce was again a candidate, being supported largely by Southern delegates, while the Northern delegates supported James Buchanan, of Pennsylvania, who was chosen on the seventeenth ballot, John C. Breckinridge being named for the vice presidency. The platform introduced a declaration in favor of insuring the ascendancy of the United States in the Gulf of Mexico and contained a declaration of the right of the Territorial governments of Kansas and Nebraska to allow slavery in those Territories. The convention of the American party nominated ex-President Fillmore, who received the eight electoral votes of Maryland, and the new Republican party (q.v.) nominated John C. Fremont (q.v.) who secured 114 electoral votes, while Buchanan was elected with 174 electoral votes. The year 1860 was disastrous to the organization of the Democratic party, inasmuch as it had become impossible to hold all factions of the party to the support of any one platform. Thus, the convention of the party, which met at Charleston, S. C., April 23, adopted resolutions which represented the middle view as to slavery rather than the distinctively Southern view, and thus led to the withdrawal from the convention of the solid delegations of Alabama, Mississippi, Florida, and Texas, as well as of many delegates from Georgia, Louisiana, South Carolina, North Carolina, Arkansas, and Delaware. The portion of the convention remaining in session adopted a resolution that a vote equal to two-thirds of a full convention should be necessary for a nomination, and after several days of ineffectual balloting, in which Stephen A. Douglas (q.v.) was easily in the lead, adjourned to meet at Baltimore on June 10. At that time the places of the Charleston seceders were filled so uniformly with followers of Douglas that a new secession took place, under the lead of some of the Virginia delegates, whose example was followed by most of the delegates from the other Southern States. Finally, the delegates still remaining virtually rescinded the two-thirds rule and declared Douglas to be their nominee for the presidency. Herschel V. Johnson, of Georgia, was nominated for the vice presidency. The delegates who had withdrawn from the Baltimore convention, representing in some manner 21 States, proceeded to nominate for the presidency John C. Breckinridge, of Kentucky, and for the vice presidency Joseph Lane, of Oregon. These nominations, furthermore, were adopted by those who had seceded at Charleston and had later met in convention at Richmond. In the following election the combined popular vote of Douglas and Breckinridge exceeded the popular vote of Lincoln by more than 350,000,

although the electoral vote of Lincoln was 180, while that of Breckinridge was 72, and that of Douglas only 12. Douglas secured the whole electoral vote of Missouri and three votes from New Jersey. The Constitutional Union party (q.v.) carried Virginia, Kentucky, and Tennessee, and the rest of the South went solidly for Breckinridge. The strength of the Democratic party was thus plainly in the South, and the effect of the war was naturally to remove the party, for the time being, from its position as a factor in national politics. Even in 1868 three Southern States were still in such relation to the national government as to lose their electoral votes entirely. In the campaign of 1864 General McClellan (q.v.), standing as a candidate in the North on a platform which declared the war was a failure, secured only 21 electoral votes as against the 212 given to Lincoln. The party having taken an attitude of criticizing both the conduct of the war and its results, its defeat was assured by the Republican nomination in 1868 of General Grant, who received 214 electoral votes, while his opponent, Horatio Seymour, received only 80, of which 33 were from his own State of New York. The in-trenchment of the Republicans in power was emphasized in the following campaign, when Grant's vote rose to 280, while for his Democratic opponents (the regular Democratic candidate, Horace Greeley, having died before the casting of the electoral votes) were cast only 63 votes. The character of the Republican administration and the vigorous attacks upon it (see CRÉDIT MOBILIER) made possible the return to effective activity of the Democrats, particularly as they had an especially strong leader who, as the reform Governor of New York and as the successful opponent of Tweed (q.v.), had become the most conspicuous Democrat of his day. The energetic campaign of 1876, however, while seeming to give Tilden substantial success, resulted in the election of Hayes, through the intervention of the Electoral Commission (q.v.). In the matter of popular vote the following election was equally favorable to the Democrats, the vote of Garfield exceeding that of Hancock by fewer than 1000. Garfield, however, received 214 electoral votes, while Hancock received only 155. In the ensuing campaign the Democrats were able to take advantage of the factional conditions within the Republican party, and this advantage was greatly increased, on the one hand, by the Republican nomination of James G. Blaine and the immediate development of the so-called Mugwump opposition to him (see MUGWUMP), and, on the other hand, by the Democratic nomination of the reform Governor of New York, Grover Cleveland. A revolt against the alleged Republican corruption, and other unusual elements, combined to bring about, for the first time since the war, the election of a Democratic president: although in 1888 Cleveland himself was defeated by Benjamin Harrison, only to be even more strikingly successful in 1892, receiving 277 votes to the 145 given to Harrison. The plank of tariff reform had thus within a decade carried the party through two successful campaigns, but the greatly increased power of the protectionists (see TARIFF) made doubtful any further success in that line by the Democrats, while at the same time a faction in the party forced to the front a new issue, seemingly a sectional issue, and, having se-

cured control of the convention of 1896, introduced the "free silver" plank into the platform and nominated William J. Bryan. In spite, however, of the aid given to the Democrats by the Populists (q.v.), the principles of the gold standard and a high tariff were indorsed in the election of William McKinley (q.v.). Four years later the Democratic party once more nominated Mr. Bryan. President McKinley received 292 electoral votes as against 155 cast for Mr. Bryan. The defeat had the effect of lessening the influence within the party of the silver and Populistic faction, so that in 1904 the party's candidate was Alton B. Parker, of New York, a conservative Democrat. He received 140 electoral votes as against 336 cast for Mr. Roosevelt. In the campaign of 1908 William H. Taft defeated Mr. Bryan, who had easily secured the nomination of the Democratic party in a convention held in Denver July 7. In the election Taft received 321 votes, and Bryan 162. In the campaign of 1912 Taft was again nominated by the Republican party. Roosevelt was the nominee of the new Progressive party in a national convention held at Chicago August 5. In an exciting convention held at Baltimore, June 25, Woodrow Wilson, Governor of New Jersey, was nominated by the Democratic party after several days' balloting, his chief rivals being Clark of Missouri, Underwood of Alabama, and Harmon of Ohio. The nomination of Wilson was due to Mr. Bryan. The Democrats declared for a tariff for revenue only, for the popular election of United States senators, for a Federal income tax, and for the nomination of candidates in primaries. In the election which ensued Wilson received 435 votes, Roosevelt 88, and Taft 8.

**DEMOCRITUS** (Gk. Δημόκριτος, *Dēmokritos*). An illustrious Greek philosopher, often popularly spoken of in both ancient and modern times as "the Laughing Philosopher," just as Heraclitus was styled "the Weeping Philosopher." He was born at Abdera, in Thrace, about 470 or 460 B.C. Of his life little is known. The statement that he was first inspired with a desire for philosophic knowledge by certain Magi and Chaldeans whom Xerxes had left at Abdera, on his Grecian expedition, is as untrustworthy as that which represents him as continually laughing at the follies of mankind. His extensive travels, however, through a great portion of the East (he lived in Egypt seven years) prove his zeal for knowledge, as does also his ceaseless industry in collecting the works of other philosophers. Democritus was by far the most learned thinker of his age. He had also a high reputation for moral worth and appears to have left a strong impression of his disinterestedness, modesty, and simplicity on the mind of the community, for even Timon the Scoffer, who spared no one else, praised him. The period of his death is uncertain. He lived, however, to a great age. Of the 72 works which, according to Diogenes Laertius (q.v.), he wrote on physics, mathematics, ethics, and grammar, only a few fragments are extant. These have been collected by Mullach (Berlin, 1843; 1880). Con-

sult also Ritter and Preller, *Historia Philosophiae Graecae* (9th ed., Gotha, 1913).

Democritus' system of philosophy is known as the atomic system. Its essence consists in the attempt to explain the different phenomena of nature, not—as the earlier Ionic philosophers had done—by maintaining that the original characteristics of matter were qualitative, but that they were quantitative. He assumes, therefore, as the ultimate elementary ground of nature, an infinite multitude of indivisible corporeal particles, atoms, and attributes to these a primary motion derived from no higher principle, existing from eternity to eternity. This motion brings the atoms into contact with each other, and from the multitudinous combinations that they form springs that vast and varying aggregate called Nature, which is presented to our eyes. Besides the atoms (matter) there is void; without void motion (and so life) would be impossible. Democritus did not acknowledge the presence of design in nature, but he admitted that of law. He believed strictly in secondary or physical causes, but not in a primary immaterial cause. With the aid of law all the phenomena of the world can be accounted for; there is no need, no room, for divine providence. Life, consciousness, thought, were, according to him, derived from the finest atoms; those images of the sensuous phenomena surrounding us which we call mental representations were to him only material impressions, caused by the more delicate atoms streaming through the pores of our organs. Democritus boldly applied his theory to the gods themselves, whom he affirmed to be aggregates of atoms, only mightier and more powerful than men. The ethics of Democritus set happiness as the aim, and by this he understood serenity of mind, undisturbed by fear or passions; hence temperance, uprightness, and noble actions are to be cultivated. The physical philosophy of Democritus, itself derived, in part at least, from that of Leucippus, was made the base of the system of Epicurus, who reared upon it a structure of ethical doctrine. See EPICURUS; LEUCIPPUS; LUCRETIUS. Consult: Zeller, *Philosophie der Griechen*, vol. i (Leipzig, 1892); Gomperz, *Greek Thinkers*, vol. i (Eng. trans. by Magnus, New York, 1905); Beare, *Greek Theories of Elementary Cognition* (Oxford, 1906); Hicks, *Stoic and Epicurean* (New York, 1910).

**DEMODOCUS** (Gk. Δημόδοκος, *Demódokos*). The bard at the court of the Phaeacian King Alcinous, who entertained Odysseus after his shipwreck. His songs are described in books vii and viii of the *Odyssey*.

**DEMOGEOT**, de-mó'zhó', JACQUES CLAUDE (1808-94). A French author, born in Paris. He taught literature in the colleges at Beauvais, Rennes, and Lyons, became professor of rhetoric at the Lycée Saint-Louis in Paris in 1843, and finally was appointed to a chair in the faculté des lettres at the Sorbonne. His most important work is the *Histoire de la littérature française depuis ses origines jusqu'à nos jours* (1851; 26th ed., 1899), held in great esteem in the literary world. He published further: *Etude sur Pline le Jeune* (1845-50); *Les lettres et l'homme de lettres au XIX<sup>ème</sup> siècle* (1856); *La critique et les critiques en France au XIX<sup>ème</sup> siècle* (1857); *Tableau de la littérature française au XVIII<sup>ème</sup> siècle* (1859); *Contes et causeries en vers* (1862); *Histoire des littéra-*

tures étrangères considérées dans leurs rapports avec le développement de la littérature française (3 vols., 1880-83); Francesca da Rimini (1882).

**DEMOGORGON** (Gk. *δαίμων*, *daimōn*, demon + *γόργος*, *gorgos*, horrible). A mysterious being whose name first appears in some manuscripts of the commentary of Lactantius (or Luctatius) Placidus to the Thebais of Statius, iv, 516, as the name of the mighty being whom all the powers of the lower world obey (Luctatius wrote about 450 A.D.). Other manuscripts show varying forms, and it is very probable that we have to do with a copyist's corruption of the Greek *δημιουργός*, *dēmiourgos*. Mythological writers of the Renaissance, especially Boccaccio, took up the word as the name of a supreme power, and thence it passed into the works of Ariosto and other poets. Demogorgon is mentioned by Spenser and Milton; in Shelley's *Prometheus Unbound* he is introduced as the mighty power which overthrows Jove. Even if the form of the name is correct, there is no reason to suppose that name or being was known to any classical writer.

**DEMOGRAPHY** (Fr. *démographie*, from Gk. *δημος*, *dēmos*, country, people + *γραφειν*, *graphein*, to write, describe). A branch of the science of statistics. In its narrower sense it deals exclusively with vital statistics, the statistics of population. In its broader sense it has been defined as "the science of statistics applied to questions concerning the social well-being of the people," and it has been considered as synonymous with statistics. The term was first used by Achille Guillard in his *Éléments de statistique humaine ou démographie comparée* (Paris, 1855), and since then it has been adopted in all countries, although it has not been accepted by all statisticians. Demographic statistics are so closely associated with anthropology that demography has been called a branch of anthropology. They are also of special importance for sociology.

Statistics of population are fundamental. In general they measure the growth and decay of population, the normal and abnormal conditions, the working of great social influences, and the pressure of antisocial forces in the community. In a more detailed form demographic data may include the following: 1. The composition of the population; the numbers, density, sex, age, parentage, defective classes, physical condition in relation to disease and epidemics, and manner of grouping from point of view of race, occupation, or civil position. 2. Changes in population, as expressed in births, marriages, and deaths. 3. Migrations and their effects, both individual and local, and their relation to economic conditions. 4. Morality, with statistics of crime, illegitimacy, and suicide. 5. Degrees of education. 6. Economic and social statistics, especially relating to insurance. In drawing conclusions from these statistics an important theoretical topic is their application to the doctrines of Malthus.

Demography is recognized as a cognate subject to hygiene, and since 1887 the International Congress of Hygiene and Demography has held annual meetings, one of which, 1912, was held in Washington, the others in various European cities. Demographic material is found in all national-bureau reports on population. In the United States the word is less widely used and in its narrow sense. For instance, Professor Mayo-Smith divides population for the study of

social organization into demographic, social, and ethnographic classes, and includes in the first only the individuals who are distinguished by differences in sex, age, conjugal condition, and physical health. The American Statistical Association also publishes much demographic material without so distinguishing it. Consult Mayo-Smith, *Statistics and Sociology* (New York, 1895), and Levasseur, "History of Demography," in *Report of International Congress of Hygiene and Demography*, vol. i (Budapest, 1894). See STATISTICS.

**DEMOISELLE**, de-mwā'zēl'. A fish of the family Pomacentridæ. These fishes are remarkable for their graceful form and brilliant colors and abound in tropical seas, haunting the coral reefs and feeding upon corals and other small creatures, much after the manner of coral fishes. A characteristically brilliant species is pictured on the Colored Plate of PHILIPPINE FISHES.

**DE MOIVRE**, de mwā'vr', ABRAHAM (1667-1754). A distinguished French mathematician. He was born at Vitry, Champagne, but spent the greater part of his life in England, whither he fled in 1688, with many others, after the revocation of the Edict of Nantes (1685). He supported himself by private tutoring and public lecturing and, towards the end of his life, by solving problems in chance, play, and annuities. He was a fellow of the Royal Society of London and a member of the Berlin and Paris academies. The *Philosophical Transactions* of London contain many of his contributions. He was so esteemed by the Royal Society that he was chosen to decide the famous contest between Newton and Leibnitz concerning the invention of the calculus. De Moivre's researches, with those of Lambert, created the part of trigonometry (q.v.) which deals with the imaginary quantities, and he contributed much to the advancement of the theory of numbers and of probability. Among his published works are: *Miscellanea Analytica de Seriebus et Quadraturis* (1730); *Doctrine of Chances* (1st ed., 1718; 2d ed., 1738); *Annuities upon Lives* (1725, and several subsequent editions). The well-known theorem which bears his name is connected with complex numbers (q.v.). It may be stated symbolically as follows:  $(\cos \phi + i \sin \phi)^n = \cos n\phi + i \sin n\phi$ .

**DEMOLITION**, dēm's-līsh'ŭn (Fr. *démolition*, Lat. *demolitio*, from *demoliri*, to pull down, from *de*, down + *moliri*, to build). The scientific destruction of works or property. In modern warfare the destruction of material is often deemed by military commanders to be essential to the success of their operations. The material destroyed on various occasions has included every kind which might be of use to an army acting either on the offensive or the defensive. The motive for demolition by troops has likewise varied from the necessity of removing an obstacle in the way of their own operations, to the advantage of embarrassing an enemy by destroying or disabling some structure that might be useful to him. In some cases, as in the famous raid through the Shenandoah valley, Va., practically everything which it was thought might contribute to the success, directly or indirectly, of the Confederate army was destroyed by General Sheridan with a view of rendering it impracticable for the Confederate army to operate in the valley as it had been doing. At the other extreme lies the destruction of a single piece of material which acted as

a barrier to the progress of an army. A typical instance of this kind was the destruction of a door during the hostilities in China. The Japanese troops were delayed at one of the gates, or doors, the approaches to which were well covered by the fire of the Chinese. A Japanese corporal undertook to effect the demolition of the gate by an explosion. After he had placed the charge, ignited a fuse, and withdrawn from its immediate vicinity, the flame was extinguished by the Chinese. This operation having been repeated several times, he finally drew his sword after lighting the fuse and stood over the explosive, permitting himself to be killed by the explosion which broke in the gate.

The exercise of good judgment is enjoined upon the officer in charge of demolitions. He should carry the destruction as far as is necessary to aid the general military project of which his work is a part; but he should not knowingly go further. The demolition of material which may subsequently be of service to the friendly army should only be undertaken with great caution. The denial of its use to the hostile army may frequently be accomplished in some other way. For example, a blockhouse or other purely military structure about to be abandoned and likely to be of considerable value to the enemy's forces should be unhesitatingly razed to the ground. While a bridge, building, railroad, or telegraph line which is useful for nonmilitary as well as military purposes should, if practicable, be crippled only sufficiently to prevent its temporary use by the enemy. Its rehabilitation will thereby be simplified, whether for later use by the friendly army or for civil purposes.

The principal agents used in demolitions are fire, explosives, and tools. Where time allows and the material to be destroyed is inflammable, as in the case of food supplies, crops, frame buildings, wooden bridges, etc., it is burned if the flame and smoke will not be objectionably conspicuous. In other cases the demolition is effected by the use of explosives, assisted sometimes by the pick, axe, and other tools.

The materials most frequently to be demolished are guns, railroads, including their bridges and tunnels, walls, doors, telegraph and telephone lines. A large gun is most readily destroyed by removing the breechblock and exploding a charge on the chase or in the bore. A railroad may be put out of commission by destroying its rolling stock or its track. Wooden cars are easily destroyed by burning. Locomotives and other machinery can be quickly disabled by removing or destroying some vital part. A locomotive can be more seriously disabled by building a fire in the empty boiler or by setting off a charge of explosive in the boiler or near some other large vital part. Railroads have been destroyed by overturning sections of the track, removing and burning the ties; the rails placed on piles of burning ties, heated in the centre, and then bent and twisted. If simply bent, it is a comparatively simple matter to straighten them. If, however, they are well twisted, the rails must be re-rolled before they can be used again. A tunnel which is a critical point of a railroad line may be put out of commission for some time by a collision and wreck therein. If it is desired to quickly and temporarily disable a road in such a way as to leave the same material available for its rehabilitation in the near future, it may ordinarily be done by overturning the track on fills and throwing it down the sides

of the embankment. Walls and doors may be broken down with picks and crowbars, or can be demolished by exploding charges against them.

The explosives ordinarily used for demolitions are gunpowder, dynamite, and guncotton. Experiments are in progress in various military countries to develop explosives still more suitable for such use. If gunpowder be used, it is necessary to tamp the charge. If guncotton, tamping is not essential. The rules governing the amount of explosive to be used are only approximate and must be considered in connection with the class of material to be destroyed. In general the amount of explosive force varies with the square of the thickness of the wall or pier to be demolished; and directly, as its length. For example, a brick wall 2 feet thick requires about two pounds per running foot of guncotton, while one 4 feet thick will require about eight pounds per running foot.

If in haste, the walls of a house may be blown down by the explosion of one or more charges of 50 pounds of dynamite in a central position. A tree 13 inches in diameter may be cut off by boring two radial holes, inserting a half-pound stick of 50 per cent dynamite in each, tamping behind the sticks with clay, and exploding the charge electrically. If the charges must be exploded with time fuses, one hole should be loaded and fired; and a second hole bored in the soundest part of the tree remaining and treated similarly. A steel rail can be cut by the explosion of three-fourths of a pound of guncotton against its web. The destruction of bridges requires judgment in the placing of the charge. In a wooden bridge the destruction can be accomplished by building a fire under one or more pieces, whose failure will cause the entire bridge to drop. Similarly, an iron or steel truss bridge may be destroyed by cutting simultaneously with explosives the lower chord of some tension member, usually near the abutments of the bridge, where the cross section is smallest. A pound and a half of dynamite is required per running foot for steel plate  $\frac{3}{4}$  of an inch thick. Charges for cutting steel must be placed on the surface and extend completely across the member to be cut. Where practicable, they should be tamped. Tamping is facilitated by placing the charges at crossings or intersections of members. Arched masonry bridges and tunnels can best be destroyed by exploding the proper-sized charge on the top side of the arch near the haunches. When impracticable to reach the top side of the arch, the destruction may be effected by propping a large charge against the crown of the arch.

The method of destroying such purely military obstacles as abatis, trous-de-loup, palisades, barricades, will usually be simple and evident, but may be as varied as the variations in construction. It will usually include the refilling of places excavated below the general level of the ground and the tearing down or burning of structures above the ground surface. Wire entanglements placed as obstacles to the advance of the troops may be rendered ineffective by cutting with wire nippers, axes, or other edged tools. Telegraph and telephone lines can be destroyed by cutting down and burning the poles; the wires should be removed and twisted or buried. A telegraph line may be temporarily disabled by removing some instruments or establishing faults, crosses, and grounds in the line.

The explosives, tools, and fuses for military

demolitions are variously carried in small packages in the saddlebags of mounted troops and in larger quantities on pack mules and wagons in charge of engineer troops.

**DEMON** (Lat., from Gk. *Δῆμων*). A Greek writer who lived about 280 B.C. He is the author of *Atthis* (*Ἀτθίς*), a lengthy history of Attica, and of works *Περὶ Παρομιῶν*, *On Proverbs*, and *Περὶ Θῶν*, *On Sacrifices*. The extant fragments of his writings are collected in Müller, *Fragmenta Historicorum Græcorum*, vol. i (Paris, 1868).

**DEMON** (Gk. *δαίμων*, *daimôn*, from *δαίωσθαι*, *daïousthai*, to divide, to apportion). In popular usage, an evil spirit or fiend, but in allusions to the classics a tutelary deity or a godling. The development of the demon concept is an interesting one. In Hesiod the souls of the departed are called demons, and Æschylus in the *Persians* makes Atossa apply the term to her deified husband, Darius. Herein seems to lie the original meaning of the word. The *daimon* is one of the many spiritual beings that determine the fate, good or bad, of individual human beings. Denoting at first the ghosts of the benignant dead who, when duly propitiated, confer boons on those who observe their cult, and later deities in a vague sense, they become in Homer immortal gods, because responsible for the decrees of fate. Then the concept entered by the time of Socrates and Plato upon its meaning of guardian spirit. In this sense Socrates called his indwelling genius *δαμόνιον*, and he fancied that it spoke within him to restrain him, but never to impel him. The sense of the word which is the most common one is a late Jewish and Christian development. Through Oriental influence there gradually arose a realistic doctrine of demons as good and evil spirits and as mediators between God and men. In the Greek version of the Old Testament the words indicating the gods of the nations are often translated as demons. This paved the way for the peculiar use among the Christians. In the New Testament, therefore, demon always has a bad sense. The spread of Christianity carried the use of the word with it, and demon thus became a synonym of devil, fiend, and maleficent spirit in general. See DEMONOLOGY. Consult Van der Veen, "De demonologie van het Jodaisme," in *Theologische Studien*, pp. 301 ff. (1890), and Baljon, article *Δαίμων*, in *Grieksch-theologisch Woordenboek* (Utrecht, 1895).

**DEMONAX** (Lat., from Gk. *Δημόναξ*). A Cynic philosopher of Athens in the second century A.D. His character has been extolled by Lucian, and he seems to have been a benignant sort of person, quite as much Socratic as Cynic. Consult Fritzsche, *De Fragmentis Demonactis* (Rostock, 1866), and Bernays, *Lucian und die Kyniker* (Berlin, 1879).

**DEMONETIZATION**. See BIMETALLISM.

**DEMONIAC** (Lat. *demoniacus*, Gk. *δαμονικός*, *daimonikos*, from *δαίμων*, *daimôn*, demon). A person supposed to be possessed by a demon. The idea of such a possession is as widespread as the belief in the existence of demons. There is evidence of it in the ancient civilizations of Egypt and Babylonia; it existed in Persia and Judæa, Greece and Rome, in the most flourishing periods of their history; it held a large place in the life of the Christian nations until the end of the eighteenth century; it is cherished by the mass of the people in India and China and is found among numerous savage tribes.

This conception has offered itself as the natural explanation of certain extraordinary and startling phenomena. The frenzy of the prophet and the dervish, the Pythoness and the Bacchant, the necromancer and the witch, could only be understood in earlier times as the obsession of a spirit, the temporary possession of a human being by a ghost. A frequent occurrence of such an unusual phenomenon would naturally give rise to the belief in a permanent possession, an incarnation of a god, a transmigration of an eminent ancestral spirit into the body of a descendant. As the divine frenzy was frequently connected with hysteria and epilepsy and seemed akin to insanity, these pathological conditions were naturally ascribed to the same agencies. Physical disabilities of long duration and apparently incurable, such as deafness, dumbness, and blindness, would also be accounted for in the same way and ultimately all bodily diseases. As in course of time the demons were differentiated as evil spirits in distinction from the good spirits, gods, angels, saints (see DEMON), persons possessed by them were thought to secure from such impure sources forbidden knowledge, heretical doctrines, unholy enthusiasm, suffering and misfortune, or a singular immunity from want and disease in exchange for everlasting perdition.

Although a belief in demoniacal possession must have grown up spontaneously among different peoples from the need of explaining such abnormal and striking phenomena found everywhere, historic contact no doubt hastened the process of development and gave shape to latent tendencies. The highly specialized demonology providing a spirit for each important organ of the body and for every familiar disease, which meets us at the very dawn of history in Egypt and Babylonia, has, directly or indirectly, influenced all nations of western Asia and Europe. Thus, in Iran, Zoroastrianism, by reciting the prayer called Ahuna-vairya, "caused all demons to vanish in the ground who aforesaid flew about the earth in human shape" (Yasna, ix, 15). Already in Homer (*Odyssey*, v. 396) a demon causes wasting sickness: insanity and epilepsy, as well as the divine frenzy of the Bacchantes, are ascribed to demons by later writers. But there is every reason to believe that the increasing emphasis on the wickedness of the demons was occasioned by conflict with Persia on the one hand and Egypt on the other. How strong the native conception was is seen from the fact that even the Neo-Pythagoreans and Neo-Platonists did not limit the term to an evil spirit, as was done in Persia and Judæa. Possession by a spirit must have been a very familiar conception among the ancient Hebrews. Without it necromancy and witchcraft could not have flourished, and prophethood would have been impossible. The high moral ideals of the prophets whose words have come down to us cannot obscure the fact that they both considered themselves possessed by a spirit, whose spokesman they became by virtue of this possession, and also regarded other prophets as possessed in a similar manner by other spirits. The immunity with which they could make personal attacks upon kings, magistrates, and priests was undoubtedly due, in no small measure, to the general fear of the spirit that possessed them. The capacity for prophetic visions or conditions seems to have been connected with a certain epileptic or cataleptic tendency. The

prophet was looked upon as a madman; the insane man was possessed by a spirit. David was perfectly safe when feigning madness (1 Sam. xxi. 13); his lament over Saul shows that he did not associate with the King his deeds in moments of insanity (2 Sam. i. 17-27). In the same way the frenzy exhibited in battle was looked upon as possession. The spirit was said to clothe himself with a man. While we have no positive evidence that disease was explained by spirit possession, the prophetic character of the literary remains in part accounts for the silence. As leprosy and pestilence were considered as the result of blows inflicted by Yahwe or some other god, coming unawares and smiting, so other sicknesses may have been traced to purely external attacks of such spirits as the Seirim or the Shedim. The growth of monolatry and transcendental theism forced the transfer of certain functions of deity to intermediaries. Then it was that contact with Persian, Egyptian, and Græco-Macedonian thought helped to develop the idea of demoniac possession so manifest in the Synoptic Gospels and the Talmudic literature. It has been observed that in no Gospel are all diseases referred to demoniac possession, and that Mark confines possession to psychical maladies such as insanity and epilepsy, while Matthew and Luke add instances of purely bodily diseases. The selection of Mark may be connected with the great importance that his Gospel attaches to the superhuman insight possessed by the demons, and it can scarcely be asserted with safety that he drew a sharp distinction between psychical and physical disease, or that he differed from the other Synoptists in regard to the cause of ordinary maladies. Some scholars have maintained that Jesus did not really believe in demoniac possession, but only accommodated himself to the current belief. This is a highly improbable view; and the discussion recorded in Matt. xii. 22 et seq. seems to be decisive against it. Here Jesus assumes that members of the Pharisaic party are able to cast out demons, but points to his own extraordinary success as a sign that the kingdom of heaven is coming and attributes his own work to a spirit working through him that must not be blasphemed. That exorcists formed a recognized profession among the Jews of the period may also be inferred from Talmudic literature, in which demoniacal possession and the possibility of expelling the demons are in numerous places accepted as facts.

Among the Celtic, Germanic, and Slavic nations there were many higher or lower nature spirits to whose influence various distempers were attributed, and, though it cannot be definitely proved, there is reason to suppose that possession was not unfamiliar to them. But their conversion to Christianity made them at once acquainted with New Testament demonology and with an ecclesiastical organization that recognized exorcists as a clerical order. (See EXORCIST.) Persons who contrived to worship in secret the ancestral gods, even after they had been officially declared to be demons by the Church, were regarded as possessed. This would be especially the case with old women who adhered most persistently to the ancient cults. Since obstinate clinging to wrong beliefs could only be accounted for by demoniac influence, heretics were also regarded as bewitched. In its battle with the demons the Church never struck a heavier blow than when Innocent VIII (q.v.),

on Dec. 5, 1484, sent out his bull *Ad futuram rei memoriam*. The methods of carrying out its recommendations were set forth with brutal frankness in the *Malleus Maleficarum*, written by his chief inquisitor, Jacob Sprenger. It has been estimated that a vast number of lives were destroyed as a result of these methods of dealing with demoniacal possession. As Luther and other leading reformers continued to cherish the belief, it maintained its hold upon the Protestant churches and was responsible for much persecution, until, undermined by the attacks of deists and rationalists, it gradually disappeared before the progress of modern science. **DEMONOLOGY.** The branch of comparative theology which concerns itself with beliefs regarding evil spirits or demons. The worship of demons is one of the most widespread of all religious phenomena. Besides the beneficent godlings or ghosts, there exists a far greater number of maleficent beings who are either divinities or supernaturalized spirits. While the beneficent deities may, and often do, receive expressions of gratitude for past bounties and prayers for continued blessings in the future from their worshippers, it is the demon or maleficent godling or ghost who receives the greater amount of human tribute. The reason for this religious attitude in primitive society is not far to seek. The beneficent deity is, in the eyes of early man, an easy-going being who dispenses blessings as a matter of course, and he may therefore be trusted to continue on in his routine goodness. An occasional sacrifice as a token of gratitude or as an inducement to confer greater boons, or to recommence an interrupted course of beneficence, is quite sufficient for him. His blessings may even be overlooked in view of their quiet and orderly action, or be forgotten altogether on account of the number of painful events which befall man. With the demon things are altogether different. His power, which he constantly exerts for harmful ends, must be met with continued propitiation, in the shape of prayer or sacrifice. Furthermore, the malignancy of the demon cannot be overlooked and is far more prominent to the primitive mind than beneficence, which, as already suggested, frequently passes unnoticed. The worship of demons is in general directly proportionate to the low character of the cult. As religion develops in any community or tribe, the demon's scope of malignancy is circumscribed accordingly, while the degree of worship paid to beneficent ghosts and gods constantly increases.

Demons comprise several classes and occur in a vast variety of forms. The two main divisions are, as in the case of beneficent divinities, either superhuman, being personifications of the powers of nature, or what may be termed posthuman, being ghosts of dead ancestors, especially of the chiefs, or of men who had been otherwise con-

spicuous in the community during life. These two classes of superhuman and posthuman godlings and demons frequently overlap, and the dividing line between them must be regarded as a shifting boundary. Here in many cases syncretism, or the blending of divinities originally distinct into one, may be the source of confusion. In such a divinity as the Greek Apollo, e.g., might be syncretized a beneficent godling of light, a ghost of some early member of a tribe conspicuous for musical ability, and the maleficent godling of light, who causes death and damage as in sunstroke. It is, in consequence, sometimes hard to tell to which division a given godling or demon belongs. Such an uncertainty is not in itself a proof of error of method. It is probably incorrect to assume an excessively nice discrimination in this regard among primitive mankind, although there is a marked tendency to elevate posthuman into superhuman divinities either beneficent or maleficent, while the change of nature deities into ghosts is practically unknown. On the other hand, the attempt to reduce all gods and demons to the single category either of nature deities or of ghosts seems an unscientific one in its fundamental principle. There may even be other factors in the origin of belief in divinities, and it is an error to assume that the primitive is necessarily simple. Furthermore, the functions of the beneficent and maleficent deities, like the classification of superhuman and posthuman, are frequently fused. Thus the fire godling may be beneficent, as in the hearth fire, or maleficent, as in the conflagration of a village. Again, a malignant deity may, by proper sacrifices and ritual, become benignant to an individual or tribe, as in an invocation to smallpox to befall one's enemies.

The Semites furnish an admirable example of the course of development of demonology. In the earliest records of Babylonia and Assyria the antithesis between beneficent and maleficent deities is clearly marked. The conflict in the Babylonian creation myth of Marduk, the god of light, with Tiamat, the demon of darkness, a conflict which is indicated by Gen. i. 2-8, and more clearly in Rev. xii. 7-9, is an instance of enmity between two nature godlings. On the other hand, Lilith, according to Talmudic tradition, seems to have been originally a malignant ghost changed into a vampire or ghoul. The Old Testament contains allusions to demons, such as the "familiar spirits" of Lev. xx. 6, 27, the "devils" of Lev. xvii. 7, Deut. xxxii. 17, 2 Chron. xi. 15, Ps. cvi. 37, the creatures that haunt the desert, Isa. xiii. 21, 22, xxxiv. 14, 15, as well as the "terror by night" and the "pestilence" of Ps. xci. 5-6. On the other hand, the strongly Yahwistic tendency of the Old Testament was most unfavorable to any development of demonology in the Bible. Even the one demon who retained any real personality, Satan (see DEVIL), plays but a small part in the Old Testament. He is a servant (even, in Job i. 6, ii. 11, reckoned among the sons) of Yahwe and completely under his control, so that he is sharply rebuked by Yahwe in Zech. iii. 1-2 and is obliged to ask Yahwe's permission to tempt Job, in Job i. 6-12, ii. 1-7. That Jewish demonology was far more developed than the extreme Yahwism of the Old Testament would lead one to suppose is clear for several reasons. In the New Testament the power of demons is frequently mentioned. Insanity and disease are laid to demoniacal possession, and Jesus is

tempted by Satan, who is represented as an independent agent of the utmost enmity to God. The existence of storm demons is distinctly implied in the account of the stilling of the tempest in Matt. viii. 26-27, Mark iv. 39, 41, and Jesus is mistaken for a spirit, either a storm demon or a malignant ghost, in Matt. xiv. 26. The Talmudic demonology, like the devil lore of other Semites, as shown by the Koran and the vast Arabic literature, of which the *Arabian Nights* furnishes a familiar example with its tales of the jinns, who are probably ghosts of benignant, or more frequently of malignant, dead, is another proof. Most conclusive of all, perhaps, is the rich demonology of modern Semitic peoples, with its superhuman and posthuman fiends.

In India the development of demonology is still more instructive. Besides the primitive nature gods, there existed nature demons no less ancient. Indra, the storm god, cleaves the dragon Ahi, who has confined the cows representing the rain clouds. Here, too, can be seen the process of syncretism more clearly than in any other religious system. For instance, Indra is the god of the monsoons and is beneficent, while the fearful Rudra typifies the ruin caused by the storm. Yet the benignant Indra and the malignant Rudra become blended into one deity, Indra, who is almost altogether beneficent. While nature demons are ancient, new ghost demons may be and are created constantly. There is an instructive story current in India of an irascible Englishman much dreaded by the natives. After his death his tomb was regularly visited, and propitiatory offerings of brandy and cigars were presented to appease his ghost. On the other hand, the ghost of Rama Krishna, a Hindu ascetic of recent date, has become a beneficent godling about whom the logopoetic tendency universal in religion has already created numerous myths.

Besides the superhuman and posthuman gods and demons, there is a third class of much later origin. These are abstract deities. They occur in nearly all the great religions, as in India, Greece, and especially in Rome. Thus, in India by the time of the later Rig Vedic period, Brahma, the prayer, is practically an abstract deity. The same we now know to be true of Mitra, 'the contract,' and Varuna, 'the oath.' Persia had a large number of abstract demons, as Tarōmaiti (Pride), Akoman (Evil Mind), Duzhyairya (Drought), and the like. In Greece and Rome it will be sufficient to refer to the long list of abstract demons enumerated by Vergil, *Æneid*, vi, 273-281. It is obvious that the abstract gods and demons are more closely allied to the nature divinities than to ghosts.

Demonology is everywhere closely associated with witchcraft. In this, two distinct processes are involved. In the first place the demon must be placed under the control of the wizard, or, more commonly, of the witch. In the second place the demon so controlled may become either noninjurious or malignant to some other person or persons. Control over the demons is gained in many ways. Thus, a beneficent deity or something belonging to him may confer the power over demons. Familiar examples are the magic ring given by Allah to Solomon in the *Arabian Nights*, which enables him to control all jinns, and the tetragrammaton, or mystic letters YHWH of the name Jehovah, or Yahwe (q.v.), during the Middle Ages. Demons may be exorcised or may be invoked against enemies

by an equal variety of methods. Possession of some object belonging to the person to be affected is one of the most common modes. For this reason many tribes have careful regulations, as the ancient Persians, who disposed of parings of nails and clippings of hair according to prescribed form. An extremely widespread superstition of this class is the so-called power of the name. According to this the knowledge of the real name of the individual gives all who possess it control over him, and this may be used for demoniacal purposes. For this reason it is customary in many tribes, as possibly among the North American Indians, to keep their personal names secret. The same view was held by the Jews, as is clear from Rev. ii. 17, xix. 12, Matt. vii. 22. Akin to this acquisition of demoniacal control is the selling of one's soul to the devil to gain some object, as in the famous Faust legend, or in the devotion of the Hindu Thugs to the malignant Kali, the wife of Shiva in his destructive aspect.

As has been suggested above, sacrifice is an important element of demonology. Since this class of offerings must be in general propitiatory, they are usually, in conformity to the nature of the demon, of a bloody or revolting character. Thus, among the Aztecs the war god, Huitzilopochtli, was honored by human sacrifices, the pulsating heart being the offering specially dear to him. The "customs" of Ashanti, with their enormous waste of life, and their cruelty to men and animals, were primarily based on the necessity of appeasing malignant gods. Even among the early Greeks a sacrifice of maidens was given each year to the Minotaur, and in early Rome the Tiber received an annual tribute of aged men. As civilization develops, the sacrifice becomes more and more ritualistic, and substitutes for the bloody offering may be made, as when, instead of sacrificing old men, dolls were thrown into the Tiber.

The change of gods into demons occurs frequently. When one tribe conquered another, it was customary for the pantheon of the defeated people to be incorporated into that of the conquerors. When, however, a nation has reached a monotheistic stage, or is inspired for any other reason by an intense hatred for the religion of the conquered, the gods of the subjected tribe may become demons. This is especially characteristic of later Judaism and Christianity and of Zoroastrianism. Thus, in Ezek. viii. 13-18, among the greatest abominations are classed the annual mourning for Tammuz, an ancient Semitic spring god, familiar to us from the Greek version of the myth in the story of Venus and Adonis, and the worship of the sun, which is most probably an allusion to Zoroastrianism. In this latter religion the gods of India (Skt. *déva*) are demons (Av. *daéva*), and great Indra seems to have been turned into a fiend Andra by the Iranians. In like manner Ceylonese Buddhism sees demons in the old Brahmanic gods, and the jinns of Mohammedanism are the heathen Arabic deities in disguise.

The worship of demons has led to the cult termed diabolism or satanism (q.v.). The earliest mention of such a belief is in the Avesta (q.v.), where adherents of non-Zoroastrian faiths are called *daevayasnians*, or demon worshippers. Persia still has a numerous sect of devil worshippers, called *Yezidis* (q.v.), who endeavor to keep on good terms with the devil that he may not injure them in the future world. A

similar tendency existed to a marked degree in early Christian Gnosticism (q.v.). The sect of the Ophites, e.g., regarded Yahwe as an evil divinity, but the serpent, because of his promise of knowledge (Gen. iii. 5), as the highest god and a benefactor of mankind. The modern cult of satanism seems to be a survival of early Gnosticism. This worship, which is, for obvious reasons, of an occult nature, seems to unite to diabolism the widespread notions of phallicism, or worship of the reproductive powers of nature. Satanism, which is now mainly a travesty of Christianity, finds its culmination in the so-called black mass, where the Christian ritual is parodied in most revolting ways.

**DEMONSTRATION, MILITARY.** An operation designed to deceive an enemy, persuading him that danger is threatening from another quarter, and inducing him to divide his force so as to meet the apparent as well as real danger. A demonstration made during the attack, in order to cover the development of the real point of attack, or to discover a vulnerable point in the defense, is called a *feint*. Before deciding the necessity for war, a *demonstration*, i.e., a concentration of military forces at strategic points, may be employed to demonstrate preparedness for war.

**DE MORGAN, AUGUSTUS** (1806-71). An English mathematician, born at Madura, India. He was educated at Trinity College, Cambridge, was graduated as fourth wrangler (1827), and was professor of mathematics in the University of London (afterward University College) from 1828 to 1831 and from 1836 to 1866. Besides being a mathematician of high rank, he was extensively versed in the history of mathematical and physical science. He gave much time in attempting to formulate Aristotelian logic into a symbolic system and contributed to the methods of calculating insurances and to the encouragement of a decimal coinage. De Morgan was the first president of the London Mathematical Society and was a member of the Royal Astronomical Society. He was a remarkable teacher and a suggestive writer, and his *Essay on Probabilities* (1838) is still one of the best in English. He died in London. The following are among his chief works: *Elements of Arithmetic* (1831); *Elements of Algebra, Preliminary*

to the *Differential Calculus* (1835); *Essay on Probabilities and on their Application to Life Contingencies and Insurance Offices* (1838); *Trigonometry and Double Algebra* (1849); *Formal Logic, or the Calculus of Inference Necessary and Probable* (1847); *Arithmetical Books* (1847); *Treatises on the Differential and Integral Calculus* (1842), published by the Society for the Diffusion of Useful Knowledge; contributions to the *Penny Cyclopædia* and to the *Encyclopædia Metropolitana*, and the *Budget of Paradoxes*, published in book form after his death. A memoir of De Morgan by his widow was published in London in 1882.

**DE MORGAN, WILLIAM FREND** (1839- ). An English novelist. He was born in London, the son of Augustus De Morgan, grandson of William Frend, and descendant of James Dodson (q.v.). As a boy he attended University College School and later for three years University College itself. He then studied art in 1859 in the school of the Royal Academy—and from 1864 to 1871 (approximately) devoted himself to working in stained glass. Subsequently, for more than 30 years, he was known as a potter who made successful experiments in glazes and lustre and wrote about his craft. He was also of a mechanical turn and invented a duplex bicycle, a smoke-consuming grate, etc. As an illustrator he may be remembered for the illustrations to *On a Pincushion and Other Fairy Tales*, written by his sister Mary Augusta. In 1904, then in his 66th year, he wrote *Joseph Vance*, a novel of well-nigh 300,000 words, which achieved an immediate success on its publication in 1906. Other novels followed, resembling *Joseph Vance* in length and in deliberation of manner. They also were warmly welcomed. De Morgan calls Dickens his master, but in many ways he is more akin to Thackeray. In *Alice-for-Short* (1907) De Morgan has been accused of imitating Wilkie Collins. *Somehow Good* (1908) is the best of his books in construction and style. After *It Never Can Happen Again* (1909) De Morgan attempted in *An Affair of Dishonor* (1910) to write a historical romance of the eighteenth century; he might have succeeded better if the plot had been less improbable or distasteful. A *Likely Story* (1912), first called *Bianca*, is in part a historical romance, with an Italian setting which repeated sojourns in Italy enabled him to paint faithfully. When *Ghost meets Ghost* (1914) is nearer the earlier manner, and scene and coincidences are piled up one on another without direct or obvious bearing upon the main drift of his tale. In all his stories De Morgan leans heavily upon the long arm of coincidence for assistance in the resolution of his plots, but his skill as a storyteller often gives a chance conclusion the air of an inevitable dénouement. His milieu is now the London slum, now English higher society. In the naturalness of his dialogue, which has the quality of living speech, he excels. He is skillful also in the use of dialects and scores notably in the dialect passages of his stories. The company of adults to whom he introduces us is often memorable and charming, and his sketches of children are singularly happy. Character is more to him than plot, and his own rambling comments have an appeal at least as strong as the narrative itself. He must certainly be counted one of the most agreeable and beguiling novelists of his generation. Consult W. L. Phelps, *Essays*

on *Modern Novelists* (New York, 1910), and F. T. Cooper, *Some English Story-Tellers* (ib., 1912).

**DEMOS** (Gk. δῆμος, *dēmos*, people). A word used in Greek to denote both the body of Athenian citizens and a political subdivision of the city, a township. A statue of the Demos (the people) by Lyson stood in the Senate House at Athens. See **DEME**.

**DEMOSTHENES** (Gk. Δημοσθένης) (c.383-322 B.C.). The greatest orator of the ancient world. He was born in the deme Peania, in Attica. His father, a wealthy manufacturer, died when Demosthenes was but seven years old; his fortune and his children he left to the care of three guardians, who abused their trust. As soon as Demosthenes came of age he prosecuted at law these trustees and gained a verdict against them; but much of the property had already been squandered, and we cannot tell whether he was able to collect the amount awarded to him by the court. His success in this and some other civil causes fixed his resolution to devote himself to public life, and he set himself to master the law and politics of his country with a labor and perseverance almost without parallel. His first appearance before the people was a failure, but this spurred him to overcome his defects. His first care was to conquer the physical disadvantages under which he labored; his health was naturally feeble, his voice harsh and tuneless, and his action ungraceful. To improve his delivery, he took instruction from Satyrus, the actor, and did not disdain to study effects before a mirror. His feebleness of health he never fairly overcame; but he obviated the defects of his early training by the severest study pursued for months at a time without an interruption. Throughout his life he gave much time to the writing of speeches to be delivered by himself, or more often by others, in private suits; 33 such orations have come down to us under his name, but only 14 of these are now regarded as by Demosthenes. He was less effective in such suits than in his political speeches.

Demosthenes first took part in public affairs when about 25 years of age; from that time his history is the history of Athens. The states of Greece were miserably weak and divided and had recklessly shut their eyes to the dangerous encroachments which Philip of Macedon was already making on their liberties. The first period of Demosthenes' public life was spent in warning his countrymen to forego their mutual jealousies and unite their forces against the common enemy, whose crafty and grasping policy he exposed, about 351 B.C., in the oration known as the *First Philippic*, the most eloquent and the most effective of his speeches against Philip and in condemnation of the supineness of the Athenians. In 347 Philip became master of Olynthus, the last outpost of Athenian power in the north, which, in a series of splendid harangues—the three *Olynthiacs*—Demosthenes had implored his countrymen to defend. Peace was now necessary for Athens, and Demosthenes and Æschines (q.v.) were among the ambassadors sent to negotiate with the conqueror; but Macedonian gold had done its work, and Demosthenes, as incorruptible as he was eloquent, saw with despair that Philip was allowed to seize Thermopylae, the key of Greece, and become a member of the Amphictyonic League.

DEMOSTHENES  
FROM THE STATUE IN THE MUSEUM OF THE VATICAN, ROME

one of the greatest controversies of the Methodist Episcopal church. Dempster's *Lectures and Addresses* were collected and published in 1864. Consult this book and also an article in the *Methodist Quarterly Review* for 1864.

**DEMPSTER**, THOMAS (c.1579-1625). A Scottish scholar and author, born at Cliftbog, in Aberdeenshire. The details of his life are given in an untrustworthy autobiography, but from other sources it seems that he was educated at Cambridge and was professor first at Pisa and later at Bologna. He left a *Historia Ecclesiastica Gentis Scotorum* (1627), which, while curiously dishonest concerning earlier personages, is sometimes valuable for the information it gives of the author's contemporaries. The Ballantyne Club issued an edition of it in 1829. Dempster's best work is an annotated edition of Accolti's *De Bello a Christianis contra Barbaros Gesto* (1623), and he also enjoyed a good reputation as a Latin poet.

**DEMULCENTS** (Lat. *demulcere*, to stroke down, soften, from *de*, down + *mulcere*, to stroke). Bland and lubricating liquid substances taken by the mouth for the purpose of soothing irritation of the mucous membranes of the gastrointestinal tract and reflexly of the larynx and bronchi. The same substances are also given in enemata to relieve irritation of the lower portion of the bowels. Water must be classed as the most valuable of the demulcents. Demulcents are chiefly composed of starch, or gum, or of substances containing these, dissolved in water; sometimes also of oily matters, or the white of eggs, and other albuminous or gelatinous substances largely diluted. The decoction of althaea, or marshmallow, is a favorite form of demulcent; flaxseed tea is a common domestic remedy of this class. Gelatine, isinglass, glycerin, honey, and starch are other demulcents in common use.

**DEMURRAGE** (OF. *demorage*, from *demorere*, to delay, from Lat. *demorari*, to delay, from *de*, down + *morari*, to delay). In admiralty law, an allowance made to the master or owners of a ship by the freighter when she is detained in port by the latter beyond the specified time of sailing. A certain number of days, called running or working days, are allowed for receiving and discharging cargo, and it is usually stipulated in charter parties that the freighter may detain the vessel, either for a specified time or as long as he pleases, on paying so much per diem for overtime. All the ordinary causes of detention, such as port regulations, the crowded state of the harbor, and the like, are at the risk of the freighter, and demurrage must be paid, though it be proved that the delay was unavoidable, unless it is due to the shipowner's fault. The demurrage ceases as soon as the vessel is cleared for sailing, though she should be prevented from actually doing so by adverse winds. When the days of demurrage are limited by special contract, and the ship is detained beyond them, the sum due as demurrage under the contract will be taken as the measure of the loss for the further time which may be claimed in the form of damages. It will be open, however, to both parties to show that the rate thus fixed per diem is either too high or too low. Where there is no stipulation beyond the ordinary agreement that the usual time shall be allowed for loading and unloading, the master will be entitled, when this period expires, either to sail

or to claim damages for detention. A suit for the recovery of demurrage is an admiralty and maritime case. Consult the authorities referred to under ADMIRALTY LAW. For the technical use of the word as a charge for the detention of freight cars, see RAILWAYS, *Freight Service*.

**DEMURRER** (Lat. *demorari*, Fr. *demorrer*, to wait or stay). A pleading which in legal effect admits the facts alleged by the opposite party to be true for the purpose of argument, but denies that they are sufficient, as a matter of law, to sustain his claim; or which sets up that there is some other defect on the face of the pleading which is a legal reason why the plaintiff should not be allowed to proceed under it. It is always based solely upon what is stated in the pleading to which it is interposed and cannot contain any other defense.

Its purposes vary somewhat in different jurisdictions; but generally, in addition to denying that the facts alleged constitute a cause of action, it may be used to put in issue the jurisdiction of the court, the capacity of the plaintiff to sue, that another action is pending between the parties for the same cause, that there is a defect of parties plaintiff or defendant, or that several causes of action are improperly joined in the same pleading. It may be interposed to any pleading of either plaintiff or defendant which alleges "new matter," i.e., something in addition to what was set out in the last previous pleading.

It is in the discretion of the court to allow the party whose pleading is thus attacked to amend if the objection is well taken and sustained, and great liberality is shown by the courts in this respect, especially where the defect is in some technical matter of form, and an amendment curing it would not prejudice the opposite party. On the other hand, if the demurrer is overruled, the demurrant is usually allowed to interpose an answer or reply to the pleading which he had attached by the demurrer if he can convince the court there is probable merit in his proposed defense. These privileges are usually granted upon terms, as the imposition of costs to date of the argument. The demurrer has been abolished in England, and other proceedings designed to accomplish like results substituted in the King's Bench and Chancery divisions of the High Court, but is retained and in constant use in most of the United States, both under the codes of civil procedure and the modified common-law system of pleading. See ANSWER; PLEADING.

**DEMY**, *dé-mi'* (Fr. *demi*, from Lat. *dimidius*, half). A term applied to those holders of scholarships in Magdalen College, Oxford, called demyships. The name would seem to be a shortened form of the Latin *demi-socii* (half-fellows), the formal term by which they are more elegantly distinguished. Of the 43 demyships, there are eight senior, each valued at £100, and 35 junior, of the value of £80 a year. Addition was a demy.

**DEMY**. A particular size of paper. In America writing demy is a sheet 16 by 21 inches, double demy being 21 by 32. In England writing demy is 15 by 20 inches; printing demy is 17½ by 22 inches; and double demy, 26 by 38½ inches.

**DENAIN**, *dé-nân'*. A town in the Department of Nord, France, at the junction of the

Selle and the Scheldt, 5 miles southwest of Valenciennes (Map: France, J 2). It owes its prosperity to its situation in the centre of an extensive coal field. The immediate vicinity of iron mines also gives it unusual facilities for smelting, and its works of this kind are of considerable importance. It has some manufactures of beetroot sugar, glass, beer, oil, ships, steel, candy, and spirits. Pop., 1901, 23,204; 1911, 26,800.

**DENARIUS** (Lat. from *deni*, ten each, from *decem*, ten). The principal silver coin of ancient Rome. The earliest money of Rome was of bronze, and the standard was the *as* (q.v.), nominally, at least at first, a pound of bronze. In 269 B.C. the *as*, which had decreased in size and value, was fixed by law at a lower valuation, and a silver coinage was introduced. The chief silver coins were the *denarius* (= 10 *asses*), the *quinarius* (= 5 *asses*), and the *sestertius* (= 2½ *asses*). At first the normal weight of the *denarius* was 4 scruples, or  $\frac{1}{4}$  of a pound (4.55 grams). About 217 B.C. the *denarius* was made equivalent to 16 *asses* (the *as* had been still further reduced), and remained so (about 17 cents) until the time of Nero, after which it underwent a gradual diminution until silver money disappeared entirely in the third century A.D. (See Plate II of NUMISMATICS.) For the earlier period, after Rome became a world power, the *denarius* was the basis of coinage outside of Italy, especially in the Adriatic territory and in western Europe. Consult Hill, *A Handbook of Greek and Roman Coins* (New York, 1899).

**DENARY SCALE.** See NOTATION.

**DE NATURA DEORUM** (Lat., On the Nature of the Gods). A treatise on the nature of the gods by Cicero, containing an exposition of the Epicurean and Stoic philosophies, and a criticism of both from the point of view of the Academics; in the form of a conversation between representatives of the three schools.

**DENATURED ALCOHOL.** See METHYLATED SPIRIT, FUEL.

**DENBIGH**, dēn'bi (Welsh, *Din-bach*, little fort). A municipal borough and the county town of Denbighshire, Wales, 30 miles west of Chester (Map: Wales, C 3), in a region of much historic interest. It stands in the vale of the Clwyd, on the sides and at the foot of a rugged, steep, limestone hill, crowned by the imposing ruins of a castle built in 1284 by Henry de Lacy, Earl of Lincoln. The town sheltered Charles I after the battle of Rowton Moor. It was taken by the Roundheads, but was dismantled after the Restoration. Other structures of interest are the Carmelite Priory (founded perhaps as early as the thirteenth century), the town hall, dating from 1572; the old parish church; a Bluecoat school (1514), and a free grammar school (1527). A lunatic asylum for the five counties of North Wales was erected near the town in 1848. The town's chief industries are bootmaking, butter making, poultry farming, and tanning and quarrying, and there is considerable timber trade. The Welsh vernacular newspaper, *Baner*, is published here. Pop., 1901, 6438; 1911, 6892. Henry M. Stanley, the African explorer, was born near Denbigh.

**DENBIGHSHIRE.** A county of North Wales, on the Irish Sea and between the Dee and the Conway. It contains 662 square miles with 8 miles of coast. The surface is rugged

and mountainous in the north; about two-thirds is under cultivation. Its corn, cheese, butter, and live stock are greatly esteemed. Near Wrexham are coal measures more than 4 miles broad. The chief towns are Denbigh, the capital, Wrexham, Ruthin, and Llangollen. The county was formed in the reign of Henry VIII. Limestone caves in the mountainous regions yield many relics of prehistoric men and animals, and there are traces of several Roman roads. Pop., 1901, 131,582; 1911, 144,783.

**DENBY**, CHARLES (1830-1904). An American lawyer and diplomat, born at Mount Joy, Va. He studied at Georgetown University and the Virginia Military Institute, was admitted to the bar in 1855, and practiced law in Indiana. During the Civil War he rose to be colonel of the Forty-second and the Eightieth Indiana Volunteer Infantry. From 1885 to 1898 he was Minister to China and in the latter year became a member of the commission for the investigation of the conduct of the war with Spain. In 1899 he became a member of the United States Philippines Commission. He wrote a valuable book on *China and her People* (2 vols., 1906).

**DENDERAH**, dēn'dēr-ä (Gk. *Τέντυρα*, *Tentyra*, Coptic *Tentore*, perhaps "the goddess," evidently the end of a longer, mutilated name). A village of Upper Egypt, on the left bank of the Nile, opposite the large city of Keneh, in about lat. 26° 12' N. (Map: Egypt, C 2). The ancient temple west of the village is one of the best preserved and most beautiful of ancient Egypt. The portico (51 yards wide) has 24 columns, bearing the head of the goddess of Denderah; the interior is divided into 27 rooms. This temple is said to stand on the site of a building dating from the time of King Cheops (q.v.), which was restored in the twelfth and eighteenth dynasties. The present structure was begun under Ptolemy XIII Auletes, and the temple was dedicated under Tiberius, although some details of the ornamentation date from his immediate successors. Among the many pictures and inscriptions, which are of rather moderate execution, a representation of the zodiac (or, better, the sky) aroused much interest after its publication in the *Description d'Égypte*; it has, however, proved to be merely a mythological representation and of no value for astronomical purposes. (Consult Letronne, *Observations sur l'objet des représentations zodiacales de l'antiquité* (Paris, 1824). For information about the cow-formed goddess Hathor of Denderah, see *ATHOR*.) The tombs of the ancient princes of Denderah of the fourth to the eighteenth dynasty were excavated by Flinders Petrie in 1898. Consult Petrie, *Denderah*, eighteenth memoir of the Egyptian Exploration Fund (1900). For the inscriptions, consult Mariette, *Denderah* (Paris, 1870-80), and Dümichen, *Baugeschichte des Denderatempels* (Strassburg, 1877).

**DENDERMONDE**, dēn'dēr-mōn'de. A fortified town of Belgium, in the Province of East Flanders, at the confluence of the Dender and the Scheldt, 18 miles east of Ghent. It has a fine church, which contains a number of paintings by Van Dyck and De Crayer, an old citadel, and an elaborately decorated fourteenth-century town hall (Map: Belgium, C 3). It numbers among its institutions a bishop's college and an academy of drawing. There are bleacheries and manufacturing establishments for the pro-

duction of leather, cotton goods, soap, and linen. Dendermonde was besieged in 1667 by Louis XIV, from whose hands it was saved by the opening of the sluices, which resulted in the flooding of the surrounding country. It was taken by the French in 1745. Pop., 1900, 9953; 1910, 10,193.

**DENDRITIC AGATE.** See MOCHA STONE.

**DENDRITE** (Gk. *δένδριον*, *dendritēs*, of or pertaining to a tree, from *δένδρον*, *dendron*, tree). The peculiar treelike or branching effect found in minerals and due to the crystallization in them of certain metallic oxides, especially that of manganese. The well-known moss agate or mocha stone is a typical illustration of the dendritic markings due to manganese oxide, which are distributed through the mineral, producing a mosslike appearance. Dendrites are frequently used as gem stones.

**DENDRITE.** A process which passes off from a nerve cell. See NERVOUS SYSTEM AND BRAIN.

**DENDROLITES.** See PETRIFIED WOOD.

**DENDY, ARTHUR** (1865- ). An English zoologist, educated at Manchester Grammar School and at Owens College, Manchester. He became an assistant in the zoological department of the British Museum in 1887; was demonstrator in the University of Melbourne in 1888-94, professor of biology in Canterbury College, University of New Zealand, in 1894-1903, and of zoology in South African College, Cape Town, from 1903 to 1905; and in 1905 was chosen professor of zoology in King's College, University of London. Besides contributions to technical journals on embryology, anatomy, etc., he wrote *Outlines of Evolutionary Biology* (1912).

**DÉNÉ.** A name frequently used for all the Athapascan-speaking Indians of the Mackenzie Basin and the Rocky Mountain region in Canada. See ATHAPASCAN STOCK.

**DENEEN, de-nēn', CHARLES SAMUEL** (1863- ). An American lawyer and public official, born at Edwardsville, Ill. He graduated from McKendree College in 1882, taught school, was admitted to the bar in 1886, and from 1890 to 1904 practiced law in Chicago. He was a member of the Illinois House of Representatives (1892), attorney for the Sanitary District of Chicago (1895-96), and State's attorney for Cook Co., Ill. (1896-1904). From 1905 to 1912 he was Governor of Illinois, he afterward served as attorney for the Butts legislative committee investigating (August, 1913) the voting-machine scandal in Chicago.

**DENFERT-ROCHEREAU, dān'fār' rō'-she-rō', PIERRE MARIE PHILIPPE ARISTIDE** (1823-78). A French officer, born at Saint-Maixent (Deux-Sèvres). He studied at the Ecole Polytechnique, entered the engineer corps, and served as a captain in the Crimean War. In 1864 he was appointed chief engineer of Belfort, of which fortress he became governor with the rank of colonel in 1870. During the Franco-German War he defended the fortress from October, 1870, to February, 1871, and surrendered only when ordered to do so by the government (February 16). He was elected to the National Assembly in 1871 and 1877. He assisted Thiers and De la Laurencie in the preparation of the *Histoire de la défense de Belfort* (Paris, 1871) and wrote *Des droits politiques des militaires* (1874). His heroic defense of Belfort is there commemorated by Bartholdi's colossal granite "Lion."

**DENGUE, den'gā** (Sp. *dengue*, prudery, fastidiousness, from Lat. *denegare*, to deny, refuse), or **BREAKBONE FEVER**, also called **DANDY** and **BUCKET** (corrupted from Bouquet) **FEVER**. The disease was first authentically observed in Spain (1764-68). It was accurately described by Brylton of Java in 1779 and by Rush of Philadelphia in 1780. In 1780 the fever was epidemic in Spain, India, and the United States; in 1827-28 in the West Indies and in Charleston, S. C.; in 1848-50 in South Carolina, Georgia, Alabama, Louisiana, and Texas. From 1870 to 1873 another epidemic spread over India, East Africa, and Java, reaching the Gulf States of the United States in 1873. In New Orleans alone 40,000 people were attacked. Other widespread epidemics occurred in 1890, 1893, 1895, 1896, 1897, and 1904, covering much the same territory. Its symptoms are chill, two febrile reactions, intense headache, pain and swelling about the joints, and severe pain in the bones, a rose-colored eruption over the body, and great prostration. It is rarely fatal. The names "dengue" and "dandy" are said to have been applied to the disease because of the stiff erectness and careful walk of those afflicted. It is now believed to be a mosquito-borne disease due to a hematozoön, differing in its life history from the malarial plasmodium in that it does not form pigment. Quinine is used in its treatment, but it has no specific effect. Calomel purges, followed by Dover's powder for sleeplessness, and the salicylates or coal-tar derivatives for pain, is the treatment generally followed.

**DENHAM, den'am, DIXON** (1786-1828). An English explorer. He was born in London, educated at Merchant Taylors' School, and was articled to a solicitor, but joined the army in 1811. He fought in the Peninsular campaign, distinguished himself at the battle of Toulouse by his daring and gallantry, and subsequently served in the Netherlands. He was associated with Clapperton and Oudney in an exploring expedition to Central Africa, which reached Lake Chad by way of Tripoli and Murzuk in 1823. In 1828 Denham became Governor of Sierra Leone. Consult his *Narrative of Travels and Discoveries in Northern and Central Africa* (1826).

**DENHAM, SIR JOHN** (1615-89). An English poet, born in Dublin, Ireland, the son of an Irish judge bearing the same name. He was educated at Oxford and studied law at Lincoln's Inn. His first publication was a tragedy, called *Sophy* (1642), performed with applause at Blackfriars. To 1642 also belongs the first version of *Cooper's Hill*, which is the earliest of English descriptive poems, and became Pope's model for *Windsor Forest*. According to Johnson, he should be credited with first making the heroic couplet terse and epigrammatic. In 1665 appeared a corrected edition of Denham's poem, containing the famous address to the river Thames: "O could I flow like thee," etc. Denham was engaged in secret service for Charles I, but, being discovered, he was obliged to escape to France in 1648, returning thence to England in 1652. After the Restoration he was appointed surveyor-general of his Majesty's buildings and created Knight of the Bath. The latter part of his life was darkened by madness, but, recovering for a short time, he commemorated the death of Cowley in one of his happiest poems. He was buried in Westminster Abbey. Consult Chalmers, *English Poets* (London,

1810), and Ward, *English Poets* (London, 1880-83). The *Bibliotheca Curiosa*, vol. i (Edinburgh, 1885), includes Denham's political satires. There is no critical edition.

**DENHARDT**, dēn'härt, CLEMENS (1852-) and his brother GUSTAV (1856-). Two distinguished German explorers, born in Zeitz. In association with the physician G. A. Fischer they undertook in 1878 a tour through the Tana River region, East Africa, which they endeavored to secure to German commerce. Six years later they entered upon a second expedition, extending from the island Lamu to Vitu (March, 1885), where the Sultan of the Swahili requested the establishment of a friendly treaty with Germany based upon proposals made by him 18 years previously. Part of the territory acquired by Clemens Denhardt was afterward transferred by him to the German colonial society known as the *Deutsche Wituesellschaft*. In 1890 all rights to this territory were ceded by Germany to England in exchange for Helgoland, the German government compensating the brothers with an indemnity of 150,000 marks. An important work by Clemens Denhardt was published in 1883 in the *Mitteilungen des Vereins für Erdkunde* at Leipzig under the title, *Anleitung zu geographischen Arbeiten bei Forschungsreisen*.

**DENIA**, dā'nē-ā (Lat. *Dianium*, from a temple of *Diana* situated there). A seaport town of eastern Spain, situated on the east coast of the Province of Alicante (Map: Spain, F 3). It has a small harbor and a lighthouse and is the seat of an important trade in raisins and salt. In its vicinity are found some Roman antiquities. Pop., 1900, 12,431; 1910, 12,161.

**DENIFLE**, dā-nēfle (FRIEDRICH) HEINRICH SUSO (1844-1905). An Austrian priest and historian, born at Imst, Tirol. He studied at Brixen and in 1861 entered the Order of the Dominicans at Gratz. Having received holy orders in 1866, he completed his studies in Rome and in 1876 became professor of theology in the Dominican monastery at Gratz and acquired high reputation as a pulpit orator. Summoned to Rome in 1880 as representative of his order for Germany, he was appointed archivist in the Vatican in 1883 and entrusted with a new edition of the works of Thomas Aquinas. He was an authority on the mystic literature and the universities of the Middle Ages. Among his principal writings are: *Nikolaus von Basel* (1875); *Das geistliche Leben: Eine Blumenlese aus den deutschen Mystikern des 14. Jahrhunderts* (1873; 5th ed., 1904); *Die Schriften des seligen H. Seuse* (1878-80), an incomplete edition; *Das Buch von geistlicher Armut* (1877); *Die Universitäten des Mittelalters bis 1400* (1885), especially important as correcting Du Boulay on the early history of the University of Paris; *Die papstlichen Registerbände des 13. Jahrhunderts, etc.* (1886); *Les universités françaises au moyen âge* (1892), supplemented by an edition (1889-97; with Chatelet) of the *Chartularium* of the University of Paris; and *Luther und Luthertum* (1904-09; last part ed. by Weis), which roused a great controversy in Germany—Denifle answering Seeberg, Harnack, and other critics of his first volume with *Luther in rationalistischer und christlicher Beleuchtung* (1904). He was associated with Franz Ehrle in editing the *Archiv für Literatur und Kirchengeschichte Mittelalters* (1885-1900) and died on his way to

Cambridge University where he and Ehrle were to receive honorary degrees. Consult the sketches by Grauert (Freiburg, 1906) and Grabmann (Mainz, 1905).

**DENIKER**, JOSEPH (1852-). A French anthropologist and ethnographer, born in Astrakhan, Russia, of French parents. He was educated at the St. Petersburg Technological Institute and, after working as an engineer in various European oil fields, at the University of Paris. In 1888 he was chosen librarian of the Paris Museum of Natural History. His book on *The Races of Man* (1900) is one of the most important works on the subject in English. In French his principal publications are: *Anatomie et embryologie des singes anthropoïdes* (1886); *Les races de l'Europe* (1896-1908); *Bibliographie des sociétés savantes de la France* (1889-95); *Les six races de l'Europe* (1904, Huxley Memorial Lectures); *Les races et peuples de la terre* (1913).

**DENINA**, dā-nē'nā, GIACOMO MARIA CARLO (1731-1813). An Italian historian, born at Revello, Piedmont. Educated at Saluzzo and Turin, he began his career as a teacher, becoming professor at Turin in 1770. Clerical opposition to his liberalism made an offer from Frederick the Great to come to Berlin acceptable in 1782. In 1804 he received a position from Napoleon in Paris. The most important of his many scholarly works is his *Delle rivoluzioni d'Italia* (1769-72), a synthetic, well-documented history of Italy, colored by French philosophy, and positioning the ancient Roman spirit, revived in the medieval communes, as the motive force of Italian life. Consult Surra, *Vita di C. D.* (Turin, 1902), and trans. of *Rivoluzioni* by Langhorne (London, 1773).

**DENIO**, HIRAM (1799-1871). An American jurist, born at Rome, N. Y. Several years after his admission to the bar he removed to Utica, where he became distinguished as a lawyer. He was three times elected judge of the Court of Appeals and retired from that office in 1866. He was one of the most distinguished jurists of his day, and his decisions are often cited. His works include: *Reports of Cases Argued and Determined in the Supreme Court and in the Court for the Correction of Error* (5 vols., 1845-48); and an edition of the *Revised Statutes of New York*, in collaboration with William Tracy (2 vols., 1852).

**DENIS**, Fr. pron. de-né', or DIONYSIUS, SAINT. The apostle of France and first Bishop of Paris, who according to tradition, suffered martyrdom in the third century. He was sent, it is said, from Rome about 250 A.D. to preach the gospel to the Gauls. He settled on an island in the Seine, near the present city of Paris, and made numerous proselytes. Sisinnius Fescennius, who was then the Roman Governor of this part of Gaul, ordered Denis to be brought before him, along with his two companions, Rusticus, a priest, and Eleutherius, a deacon. As they continued firm in their faith in spite of threats, he caused them to be cruelly tortured and afterward beheaded, 272 A.D., or, as others say, 290. Gregory of Tours, Fortunatus, and the Latin martyrologists state that the bodies of the three martyrs were thrown into the Seine, but taken up by a pious woman named Catulla and interred near where they lost their lives. At a later period a chapel was built over their tomb. In 636 King Dagobert founded on the spot the Abbey of St. Denis. The Greek church makes

St. Denis to be the same person as Dionysius the Areopagite, first Bishop of Athens (q.v.). The Roman Catholic church celebrates his memory on October 9. For a long time his name was the war cry of the French soldiers, who charged or rallied to the words *Montjoie Saint Denis*. Consult Verceley, *Vie de Saint Denis* (Paris, 1854), and Tailliar, *Apostolat de Saint Denis* (Amiens, 1869).

**DENIS, de-né', JEAN FERDINAND** (1798-1890). A French traveler and author. He was born in Paris and early devoted himself to the study of the principal European and Oriental languages with a view to a diplomatic career. His love of travel, however, induced him to go to South America in 1816; he spent several years in Brazil, studying its condition and resources, and after his return home prepared to write a history of that realm and of some of the other South American countries and subsequently visited Portugal and Spain. In 1838 he was appointed librarian in the Ministry of Public Instruction, and in 1841 custodian of the library of Sainte-Geneviève, of which he became administrator in 1865. Among the great number of his writings may be mentioned: *Le Brésil, ou histoire, mœurs, usages, et coutumes de ce royaume* (1821); *Buenos Ayres et le Paraguay* (1823); *La Guyane* (1824); *Scènes de la nature sous les tropiques, et de leur influence sur la poésie* (1824); *Résumé de l'histoire littéraire du Portugal et de l'histoire littéraire du Brésil* (1826); *Chroniques chevaleresques de l'Espagne et du Portugal* (1837); *Le Brahme voyageur ou la sagesse populaire de toutes les nations* (1833); *Camocens et ses contemporains* (1841).

**DENIS, dā'nīs, MICHAEL** (1729-1800). An Austrian bibliographer and poet. He was born at Scharding, Upper Austria, and was educated at Passau by the Jesuits, whose order he joined in Vienna in 1747, devoting himself to the profession of teaching. In 1784 Denis was appointed custodian of the Imperial Library. He deserves much credit for having elevated the standard of bibliography as a science, but his chief merit is that he furthered literary taste in Austria, making that country participate in the revival of letters which was then agitating Germany. He translated Ossian into German and was a great admirer of Klopstock, in imitation of whose bard poetry he composed lyrics under the name of "Sined [anagram of Denis] the Bard." His poetic productions comprise: *Poetische Bilder der meisten kriegerischen Vorgänge in Europa seit 1756* (1760); *Die Lieder Sineds des Barden* (1773); *Ossians und Sineds Lieder* (1784-85). Among his valuable bibliographical writings are: *Grundriss der Bibliographie und Bucherkunde* (1774); *Einleitung in die Bucherkunde* (1777-78); *Merkwürdigkeiten der rarellischen Bibliothek* (1780); *Wiens Buchdruckergeschichte bis 1560* (1782; supplement, 1793); *Lesefrüchte* (1797).

**DENIS, dā'nīs, PAUL CAMILLE** (1795-1872). A German civil engineer, born at Mainz. He studied at the Ecole Polytechnique of Paris, entered the Bavarian civil service in 1817, and in 1834 became a member of the commission for the construction of the Danube-Main Canal. In 1835 he built from Nuremberg to Fürth the first railway in Germany. Subsequently he was known as a builder and director of railways.

**DENISON.** A city and the county seat of Crawford Co., Iowa, 65 miles north by east of Council Bluffs, on the Boyer River and on the

Illinois Central and the Chicago and Northwestern railroads (Map: Iowa, B 3). It is the seat of a normal and business college, contains a hospital, and carries on a considerable trade in live stock, grain, flour, poultry, and dairy products. The leading industrial establishments are flouring mills, a cold-storage and ice plant, and creameries. There are municipal water works. There was an Indian massacre at Fort Purdy, 1 mile from here, in 1849. Pop., 1900, 2771; 1910, 3133.

**DENISON.** A city in Grayson Co., Tex., 72 miles north by east of Dallas, on the Missouri, Kansas, and Texas, the Missouri, Oklahoma, and Gulf, the Texas and Pacific, the Houston and Texas Central, and the St. Louis and San Francisco railroads (Map: Texas, D 3). It is a railroad centre, containing shops of four systems, and has important manufacturing and jobbing interests. There are cotton, cottonseed-oil, and flouring mills, creosote works, a handle factory, grain elevators, and a mattress and felt factory. Among the noteworthy features are St. Xavier's Academy, Washington School, public library, Union Station, government building, Forest and Munson parks, and the city hospital. Settled in 1872, Denison was incorporated the same year. It has adopted the commission form of government and owns its water works. Pop., 1900, 11,807; 1910, 13,632; 1914 (U. S. est.), 14,409.

**DENISON, CHARLES WHEELER** (1809-81). An American clergyman and author, born in New London, Conn. For a time he edited the *Emancipator*, one of the early antislavery periodicals; in 1853 was appointed United States Consul in British Guiana, and during the Civil War spoke in behalf of the Federal cause among English workmen in Lancashire, and was post chaplain at Winchester, Va., and a hospital chaplain at Washington, D. C. His publications comprise two volumes of verse, *The American Village and Other Poems* (1845) and *Out at Sea* (1867); a story, *Antonio, the Italian Boy* (1873); *The Child Hunters* (1877); and biographies of Generals Grant, Hancock, and Banks.

**DENISON, GEORGE TAYLOR** (1839- ). A Canadian soldier and author, born in Toronto. He was educated at Upper Canada College and Toronto University (LL.B., 1861) and was called to the bar in 1861. He early entered the volunteer militia service and in 1868 became lieutenant colonel of the Governor-General's bodyguard. In the same year he was on active service during the Fenian raid. Although of Conservative affiliations, he was not a strict party man, his attitude being determined by his concern for the assertion of Canadian interests so far as these were consistent with the unity of the Empire. In 1867 he was one of the founders of the Canada First party. In 1872 he was an unsuccessful Liberal candidate for the House of Commons. In 1872 and 1873 he was sent by the Ontario government to England as a special commissioner on matters connected with immigration, and in 1877 he was appointed police magistrate of Toronto. He was again on active service during the rebellion led by Riel in the Northwest Territories in the spring of 1885. He was president of the Imperial Federation League in Canada in 1893-95 and became president of its successor, the British Empire League in Canada, in 1896. In 1903 he was appointed president of the Royal Society of Canada, and in 1910 vice president of

the Royal Colonial Institute. He began early to write on military subjects and also on problems of national defense. His *History of Cavalry* (1877) won the prize of 5000 rubles offered by the Czar for the best work on that subject, was translated into Russian and subsequently also into German and Japanese. He also wrote: *The Fenian Raid at Fort Erie* (1866); *Cavalry Charges at Sedan* (1872); *Canada and her Relations to the Empire* (1895); *Soldiering in Canada* (1900); *The Struggle for Imperial Unity* (1909).

**DENISON, HENRY WILLARD** (1846-1914). An American jurist, born in Guildhall, Vt., and educated in the Lancaster (N. H.) Academy and the Columbian Law College, Washington. In 1889 he was appointed United States Vice Consul to Kanagawa, Japan, and in 1890 left the consular service to become the legal adviser of the Japan Foreign Office. At Portsmouth, N. H., in 1905 he was the representative of Japan in the drafting of the peace treaty with Russia. He became a member of the Permanent Court of Arbitration of The Hague and of the Association de Législation Comparée, Paris, and was decorated with the grand cordons (first class) of the Imperial Japanese Order of the Rising Sun and of the Japanese Order of the Sacred Treasure.

**DENISON UNIVERSITY.** An educational institution, situated at Granville, Ohio. The university was organized by the Baptist Education Society in 1831 as a manual-labor school, under the name of the Granville Literary and Theological Institution. The manual-labor idea, however, did not prove successful and was soon abandoned. In 1856 the name of the institution was changed to Denison University in honor of William S. Denison, one of its principal benefactors. The theological department was discontinued in 1870. The university offers degrees in arts and science. In 1900 Shepardson College for women, established in 1887, became affiliated with the university. The property value of the two institutions, including their endowment funds, is estimated at about \$1,250,000. The university had a registration in 1914 of over 600 students. The library contained about 35,000 volumes besides pamphlets.

**DENITRIFICATION.** See NITRIFICATION.

**DENIZEN** (Af. *denzein*, *denezyn*, OF. *deinz*, Fr. *dans*, within, from Lat. *de*, from + *intus*, within). One who was born an alien (q.v.) to his adopted country, but who has been granted some of the privileges of citizenship. In England "denizen" signifies one who has been admitted to become a citizen by letters patent from the crown, his rights dating from the time when they were conferred; and he is distinguished from a naturalized citizen, whose rights are granted by Parliament and are retroactive, giving him the same status as if he were a natural-born citizen. A denizen in England is also under certain political disabilities as to holding office, and he is subject to certain taxes from which other citizens are exempt. He is said, therefore, to occupy a middle position between an alien and a natural-born or naturalized subject. In the United States the terms "denizen" and "naturalized citizen" are used synonymously, there being no distinction. Naturalization (q.v.) is held here not to be retroactive; but when one becomes a denizen or naturalized citizen, he has from the date of his admission to citizenship practically all the

rights and privileges of a natural-born citizen. The Constitution provides that no one not a natural-born citizen may become President, but otherwise there are no constitutional limitations on the rights of a naturalized citizen. See CITIZEN; NATURALIZATION; SUBJECT.

**DENIZLI**, *dén'iz-le'* (Turk. *deniz*, sea). A town of Asiatic Turkey, in the Vilayet of Smyrna, on the Smyrna-Dineir Railway (Map: Turkey in Asia, C 4). In its vicinity are situated the ruins of ancient Laodicea. The situation of Denizli amid beautiful gardens and vineyards at the base of the Baba Dag has earned it the title of the "Damascus of Anatolia." It has a bazar, khans, and leather-curing and manufacturing industries. Pop., about 20,000.

**DENK, HANS** (c.1495-1527). A German Anabaptist. He was born in Bavaria, studied at Ingolstadt, was proof reader in Basel, rector of a school at Nuremberg in 1523, and there met Thomas Münzer, and so first came in contact with Anabaptism, which he accepted with modifications. In consequence he was banished from the city, January, 1524, and forced upon that wandering life which he henceforth led until his death, in Basel, November, 1527. His writings are very scarce. He was essentially a mystic and, like his class, mingled truth and error. For his life, consult L. Keller (Leipzig, 1527).

**DEN'MAN, THOMAS, BARON** (1779-1854). An English jurist. He was born in London, educated at Cambridge, and was called to the bar in 1806. On the accession of George IV he was appointed Solicitor-General to the Queen, and in conducting her defense won a considerable reputation both as a lawyer and as a speaker, but earned the enmity of the King, who for some time thereafter opposed his advancement. In 1818 he was elected to Parliament, and took a seat with the Whig Opposition, serving there until 1826 and being returned again in 1830. In the latter year he was made Attorney-General, and two years later became Lord Chief Justice of the King's Bench. In 1834 he was raised to the peerage. He resigned the office of Chief Justice in 1850 and retired to private life. His character was marked by high moral and social virtues. As a jurist, he was especially interested in the subject of law reform and instituted important changes in the code. He also strove with great energy, both as a writer and as a judge, to effect the abolition of the slave trade.

**DENMAN, WILLIAM** (1870- ). An American lawyer, born in San Francisco, Cal. A graduate of the University of California (1894) and of Harvard Law School (1897), he became a prominent member of the California bar. He defended the eight-hour law for women, was counsel in various important admiralty cases, and served as assistant professor of law and lecturer at the Hastings College of Law and the University of California. In 1908-10 he was chairman of a committee appointed by the mayor of San Francisco to report on causes of municipal corruption. A movement which he organized in 1908 to secure nonpartisan election of judges resulted in the passage of a law to this end in 1911. He also drafted a nonpartisan majority election law, which is now part of the San Francisco charter.

**DEN'MARK.** The smallest of the three Scandinavian kingdoms of Europe (Map: Eu-

rope, D 3, and special map). It comprises the northern portion of the Cimbrian peninsula, called Jutland, the Danish Archipelago east of the peninsula, the island of Bornholm, and the Faroe Islands, making a total area of 15,682 square miles. Not reckoning the Faroe Islands, it lies between lat. 54° 33' and 57° 45' N. It is almost surrounded by the sea, Jutland being connected with the Continent only at the southern frontier, in which place the peninsula is less than 40 miles wide.

**Topography.** The west and northwest coasts of Jutland, which are washed by the North Sea and the Skagerrak, are low and girt by dunes and sand bars. Behind the dunes there are several large lagoons or inclosed bays, but they are usually too shallow to serve as harbors. The north extremity of Jutland is formed by the Skagen, a long, curved sand spit. The east coast along the Kattegat lies at a somewhat higher level and is indented by a series of inlets (fjords) that penetrate deeply into the interior; Limfjord, the most northerly, reaches across the peninsula and communicates through a tortuous course with the North Sea. Some of the inlets may be entered by ships of light draft. Between the south of Jutland and the south extremity of Sweden are Fyn and Zealand, the largest islands of Denmark, dividing the outlet of the Baltic into three passages—the Little Belt, between Jutland and Fyn; the Great Belt, separating Fyn and Zealand; and the Sound between Zealand and Sweden. Both islands have an irregular and sandy coast line. The surface of Denmark is uniformly low. A ridge of hills crosses the middle portion of Jutland from the southern frontier to the Limfjord, of which the highest point, Himmelberg, near Aarhus, a little more than 500 feet, is not exceeded. The ridge constitutes the water parting between the North Sea, which receives the Stor Aa, the Lönborg Aa, and the Varde Aa, and the Kattegat, which receives the Guden Aa, the largest river of Denmark, with a length of about 80 miles. Many lakes, characteristic of glaciated areas, abound.

**Climate.** The climate of Denmark is like that of eastern Scotland, but it is somewhat warmer in summer and colder in winter. The mean temperature at Copenhagen is about 60° F. in summer and about 32° F. in winter. In general the islands have a milder climate than Jutland. In winter the sound and other channels are sometimes filled with drifting ice; the blockade, however, does not continue for any length of time. Heavy rains are frequent in autumn, and mists in summer, especially on the west coast of Jutland. The annual rainfall ranges from 21 to 27 inches.

**Flora.** The flora of Denmark includes many of the common European plants and a number of species peculiar to the moorlands. Formerly there were extensive forests of beech, but these trees are now practically limited to cultivated lands. Besides the beech the tree most commonly found is the oak. About 5 per cent of the total area is forested.

**Fauna.** The fauna has no noteworthy characteristics. Fishes and aquatic birds abound. Salmon are found in the Guden Aa and oysters in a few localities. In 1911 the value of the fish caught was \$4,193,000.

**Geology.** With the exception of Bornholm, which belongs physically to Sweden, the entire area of Denmark may be regarded as a continua-

tion of the plains of North Germany. The surface consists of boulder clay and sand, resting upon stratified rocks of generally Cretaceous age. The clay was deposited during the Pleistocene epoch by the Scandinavian ice sheet. West and north from Jutland there are large tracts of moorlands which yield peat, but no metallic ores occur in any part of the country. Bornholm is formed by Paleozoic and Mesozoic rocks and has the same geological structure as the southern part of Sweden. Kaolin and a poor grade of coal are mined on this island.

**Agriculture.** Denmark proper is essentially an agricultural country. Nearly 39 per cent of the population are engaged in agriculture. The laws forbid the uniting of small farms into large ones and favor the parceling out of landed estates. The peasant proprietors are consequently increasing both in number and importance. The division of the land into very small holdings is successfully associated with a well-developed system of coöperation, which enables small farmers to use the most improved and expensive machinery, etc. Tenants in good standing have absolute charge of their land. About 75 per cent of the total area of the country is productive land (not including woodland). In 1907, of the total area of 3,896,870 hectares, 1,122,761 were under cereals, 308,362 under roots, etc., 27,247 under other crops (excluding hay), 230,413 fallow, etc., 1,229,585 in herbage and pasture; of the remaining 978,502 hectares, 324,241 were woodland (including public parks), 382,450 were not utilized, and 56,459 were inland water. In 1912, 40,512 hectares were sown to wheat, yielding 983,875 metric quintals; rye, 276,009 hectares, 4,799,236 quintals; barley, 233,714 hectares, 5,439,031 quintals; oats, 402,939 hectares, 7,520,647 quintals; sugar beet, 30,300 hectares, 9,860,071 quintals. The production of raw sugar in 1912 was 1,530,000 quintals. (Hectare = 2.47 acres; quintal = 220.5 pounds.) Stock raising is an important industry. In 1910 horses numbered 535,018, cattle 2,253,982, sheep 726,829, goats 40,267, and swine 1,467,822.

**Manufactures.** The manufacturing industries are chiefly on a small scale. The industrial census of 1906 gives the number of establishments as 85,242, with a personnel of 317,086, of whom 208,444 were industrial laborers. Of these establishments but 1248 had between 21 and 100 hands, and only 218 over 100 hands each; 12,379 establishments, with 80,106 workers (out of the 208,444), were in Copenhagen. The principal manufactures are furniture, foodstuffs, articles of apparel, metal products, and porcelain. The textile industries are confined chiefly to the rural districts. Manufacturing is increasing in importance, partly in consequence of the industrial schools. Most of the important plants are in Copenhagen. In 1911 the distilleries in the whole country numbered 27, and their output of spirit (reduced to 100 per cent) amounted to 15,550,000 liters. In that year 1,115,000 hectoliters of excisable beer were produced and 1,550,000 hectoliters nonexcisable, 116,150 metric tons of sugar, and 35,400 metric tons of margarine. There is some manufacturing of machinery and also a little iron smelting. The industrial joint-stock companies of Denmark are a significant feature in its manufacturing development.

**Transportation and Communication.** Most of the towns of Denmark are situated on the coast or on navigable rivers. Steamboats ply

constantly between the islands. At the end of 1911 there were, outside of Copenhagen, 4344 miles of road and over 22,500 miles of byways. The first railway within the present confines of the country (Copenhagen-Roskilde) was constructed by a private company and opened for traffic in 1847. Prior to 1880 the state railway lines were confined to the mainland and the island of Fyn, while private companies controlled all lines on the islands of Seeland, Lolland, and Falster. In 1880 an Act was passed authorizing the acquisition of the Seeland lines. At the end of 1911 the length of railway open to traffic was 3691.3 kilometers (2293.7 miles), of which 1922.8 kilometers were owned by the state and 1768.5 by private companies. The cost of the state lines to the end of the fiscal year 1912 is stated at 270,649,217 kroner. (Krone = \$0.268.) In 1913 the state telegraph lines had a length of 3621 kilometers, with 13,005 kilometers of wire and 1017 offices; there were 8 wireless telegraph stations besides 19 on board ship.

The merchant marine (including vessels of over 4 tons' register) on Jan. 1, 1913, comprised 642 steamers, of 415,436 tons' register, and 2062 sail, of 91,188 tons; total, 3564 vessels, of 522,143 tons. In the foreign trade there entered at Danish ports, in 1912, 38,667 vessels, of 4,387,258 tons (steam, 23,074 vessels, of 3,741,958 tons), and cleared 39,339 vessels, of 1,623,077 tons (steam, 23,578, of 1,399,639 tons).

**Commerce.** Although the foreign trade has not grown at so rapid a rate as that of some other countries, Denmark has had, nevertheless, a fair share in the modern commercial expansion of the world. In 1875 imports for consumption and exports of domestic produce (i.e., the special trade) amounted to \$62,617,500 and \$46,122,800 respectively; in 1890, \$82,276,000 and \$32,658,400; in 1900, \$111,541,600 and \$75,549,200; in 1905, \$129,430,600 and \$104,761,200; in 1910, \$154,680,500 and \$130,080,200; in 1912, \$197,962,200 and \$159,921,800. The development in both import and export values has been notable since 1900. The leading imports are cereals, oil cake, metals and hardware, textile manufactures, coal, wood manufactures, and timber. The principal exports are as follows (the values being for 1912): butter, \$51,211,584; meat (largely bacon), \$47,249,792; live stock, \$14,521,580; eggs, \$7,289,868; hides, 4,168,740. The general commerce (which includes, besides the special trade, imports of foreign merchandise for reexportation) in 1912 amounted to \$219,093,216 for imports and \$182,797,976 for exports. In the general commerce of 1912 imports from and exports to the United Kingdom were valued at \$36,417,716 and \$9,999,872 respectively; Germany, \$84,217,928 and \$48,681,128; Sweden, \$18,508,080 and \$8,938,336; Norway, \$2,456,488 and \$4,968,988; Russia, \$15,054,900 and \$4,380,996. Imports from North America were \$19,474,220, while the exports thereto were only \$3,118,716. The largest share of the imports comes from Germany, and that of the exports goes to the United Kingdom. Imports from and exports to the United States in 1912 amounted to \$15,767,348 and \$2,832,418.

**Banks.** The only bank of issue is the National Bank at Copenhagen (established 1818); in 1912 its assets and liabilities balanced at 208,205,596 kroner. At that time there were 135 other banks, for general commercial and industrial purposes. The assets and liabilities

of the 136 banks (including a number of affiliated institutions) balanced at 1,440,111,119 kroner, of which 1,068,892,157 kroner represented 12 banks at the capital (i.e., Copenhagen with Frederiksberg). The note issue amounts to about 154,000,000 kroner. At the end of the fiscal year 1911 there were 521 savings banks, with 1,353,384 depositors and deposits amounting to 803,007,171 kroner. The number of deposits was equal to nearly 49 per cent of the number of inhabitants; the average deposit was about 593 kroner, or \$159.

**Government.** Denmark is a constitutional monarchy, hereditary in the male line of the house of Schleswig-Holstein-Sonderburg-Glücksburg. The constitution bears date of June 5, 1849, revised July 28, 1866.

The lawmaking power is vested in the king and in the Rigsdag, or parliament. The Rigsdag consists of the Landsting, or upper house, and the Folkething, or popular chamber. The Landsting is composed of 66 members, of whom 12 are appointed for life by the crown, and the remainder are chosen for a term of eight years, partly by the representatives of the highest taxpayers in the towns and rural districts and partly by the representatives of the people at large. The Folkething is composed of 114 deputies, elected for three years by all male citizens of 30 years or over not in receipt of public charity or engaged in menial household service and resident for a year in the district in which they enroll. While 30 is the age of franchise, 25 is that of eligibility to either house of parliament. Legislation may be initiated in either house, but financial bills must be submitted in the first instance to the Folkething, and only on the initiative of the executive. In practice the Landsting enjoys a very large degree of influence, owing to its feature of comparative permanency; and in conjunction with the king, who wields an absolute veto on legislation, it is frequently in the position of directing the action of parliament. The executive power is vested in the king, who acts through a council of nine responsible ministers, who preside over the departments of Foreign Affairs, Finance, Interior, Justice, National Defense, Public Instruction and Worship, Agriculture, Public Works, and Commerce and Navigation. There is also a minister for Iceland.

Justice is administered in the first instance by the judges of the hundreds in the rural communities and by the city magistrates in the urban districts. Appeals from such courts lie to the superior courts of Viborg and Copenhagen, and in the last resort to the Supreme Court of 24 judges (Højesteret) at Copenhagen. Together with four judges especially appointed by the Landsting, the Supreme Court sits as a tribunal for the cases of impeached ministers.

**Army and Navy.** The Danish army is raised by conscription from among all citizens above the age of 20. Substitution is not permitted. The terms of service are eight years with the regular army and its reserve and eight years with the supplementary reserve. The standing army in 1913 approximated 975 officers and 13,200 men. The war footing of the nation is placed at about 84,000 men. The infantry is armed with the Krag-Jorgensen rifle, and the cavalry with the Remington carbine. The field artillery is armed with a Krupp gun firing a 14.88-pound shell. The navy is maintained only for purposes of coast defense. It consists of

several monitors, torpedo gunboats, torpedo boats, submarines, etc.

**Finance.** The standard of value is gold. The monetary unit is the krone (crown), par value 26.799 cents. Revenue and expenditure in the fiscal year 1910 were 81,948,924 and 113,120,921 kroner respectively; in 1911, 90,903,801 and 119,902,100; in 1912, 101,404,844 and 118,754,904. The budget for the fiscal year 1914 showed estimated revenue and expenditure of 112,214,910 and 104,804,334 kroner respectively. Indirect taxes (customs and excise) were estimated at about 60,000,000 kroner and direct taxes at about 35,000,000. A considerable reserve fund is maintained for emergency. At the end of the fiscal year 1913 the public debt was: foreign, 272,287,250 kroner; interior, 84,352,218; guaranties, 1,401,455; total, 358,040,923. Service of the debt (1914 budget), 12,337,162 kroner.

**Colonies.** Iceland, Greenland, the Faeroes, and the West Indian islands of St. Croix, St. Thomas, and St. John belong to Denmark. The Faeroes are not a colony, but form a department, or amt, of the kingdom and are represented in the parliament; however, their area (540 square miles) and population (18,000 in 1911) are not included with Denmark proper. Iceland has a parliament of its own. The area of Iceland is 40,457 square miles; its population in 1911 was 85,188. Greenland, whose commerce is a state monopoly, is directly under the home government. The area of the island of Greenland is not known with accuracy, but may be placed at about 889,400 square miles; the administered area, in the southwest part, is estimated at 34,015 square miles: pop., 1911, 13,462. The Danish West Indies have consultative representation in the administration directed by the home government. Their area is 139 square miles; pop., 1911, 27,104. See ICELAND; GREENLAND; ETC.

**Population.** The population of Denmark proper in 1801 is stated at 929,001; in 1840, 1,269,075; in 1880, 1,969,039; in 1890, 2,172,380; in 1901, 2,449,540; in 1906, 2,588,919; in 1911, 2,757,076. By insular and mainland divisions the area and the population in 1901 and 1911 (census of February 1) are shown in the following table:

	Sq. miles	Pop. 1901	Pop. 1911
<b>Islands</b>			
Zealand	2,895	960,053	1,096,697
Bornholm	227	40,889	42,885
Lolland-Falster	692	105,021	115,658
Fyn	1,341	279,755	303,179
Total islands	5,155	1,385,748	1,558,619
<b>Jutland:</b>			
Southeast Jutland	2,827	430,549	482,264
Southwest Jutland	4,144	313,764	364,620
North Jutland	2,920	319,479	351,573
Total Jutland	9,891	1,063,792	1,198,457
Denmark proper	15,046	2,449,540	2,757,076
Faeroes	540	15,230	18,000
Total	15,586	2,464,770	27,75,076

The following table shows the population of the capital (Copenhagen with Frederiksberg), of other towns, and of the rural communes. The more rapid urban growth, as compared with the rural, is marked.

YEAR	Capital	Other towns	Rural communes	Total
1870	198,169	245,398	1,341,274	1,784,741
1890	359,813	362,431	1,450,136	2,172,380
1901	476,806	482,099	1,490,635	2,449,540
1906	514,134	508,200	1,565,585	2,588,919
1911	559,398	550,328	1,647,350	2,757,076

Of the total population in 1911, 1,337,900 were male and 1,419,176 female. In respect of religion the population is remarkably homogeneous, the number returned in 1911 as of the national church (Lutheran) being 2,715,187. Roman Catholics numbered 9821, Anabaptists 5664, and Methodists 4284. The inhabitants born in Denmark numbered (1911) 2,655,522; Germany, 34,535; Sweden, 33,312; Norway, 4696. In 1912 marriages numbered 20,413; births and deaths (each including stillbirths), 76,405 and 38,170 respectively; excess of births, 38,235; emigrants, 8636. Population of the larger cities and towns in 1911: Copenhagen, 462,161; Frederiksberg (suburb of Copenhagen), 97,237; Aarhus, 61,755; Odense, 42,237; Aalborg, 33,449; Horsens, 23,843; Randers, 22,970; Esbjerg, 18,208; Vejle, 17,261; Fredericia, 14,228; Kolding, 14,219; Helsingør, 13,783; Svendborg, 12,667.

The Danes are a Teutonic people of the Scandinavian group. Height, 1.685 meters; hair, wavy, light brown or chestnut; eyes blue; complexion pale white, swarthy, or very light brown. Primary education is free and compulsory between the ages of 7 and 14 and is very thoroughly diffused. There are numerous secondary schools. Denmark has one university, that of Copenhagen (about 3000 students). There are also an agricultural and veterinary college, 19 agricultural or horticultural schools, the Royal Academy of Art (founded in 1754), the Polytechnic Institute, a college of pharmacy, and about 100 technical and commercial institutions.

**History.** Of the primitive history of Denmark little is known. The kitchen middens and other primitive remains indicate the early presence of paleolithic man in the Danish peninsula. The sagas hand down myths and traditions of later but still early ages, when the original inhabitants had been crowded out by wandering tribes of Germanic stock, and Jutland and the islands had become the homes of Saxons, Angles, and Jutes. This was probably completed about the second century of our era, but was followed by an invasion of the Danes in the fifth and sixth centuries. Less influenced than the other Teutonic peoples by the Romans, the inhabitants in the Scandinavian countries developed a striking and characteristic civilization, marked by a warlike and adventurous spirit, which sent them as Vikings and conquerors over all Europe and as far as America. Christianity was preached by Ansgar in Denmark in the ninth century, but the conversion of the land dates from the second half of the tenth century. After the ninth century we find a united Danish kingdom growing out of the petty principalities into which the country was divided. We hear of Danish kings as early as the eighth century, but know little of them; in the tenth century Gorm the Old is said to have been a bitter opponent of Christianity; but the first Danish ruler of prominence was Svend (Sweyn) I, of the Forked Beard (985 or 986-1014), a redoubtable sovereign who for a brief

period imposed his yoke upon England. Svend's son, Knut or Canute (died 1035), King of England and Denmark (see CANUTE), was a really great sovereign, under whom the conversion of the Danes to Christianity was completed, and much was done to civilize the kingdom and bring it into order. After his death the northern empire which he had created fell apart, and the Odinic dynasty of the Skjoldungs became extinct in 1047.

Svend Estridsen, son of Knut's sister, now ascended the throne. Internal dissensions and external wars led here as elsewhere to the introduction of a feudal system. A new era of brilliant achievements began with Valdemar I the Great (1157-82) and continued under Knut VI (1182-1202) and Valdemar II the Victorious (1202-41). These kings extended the conquests of Denmark far into German and Wendic lands and made the Baltic little more than a Danish sea. The jealousy of the German princes and the treachery of his vassals combined to rob Valdemar II of these conquests. His death in 1241 was followed by a century of anarchy, during which the kingdom was brought near to destruction under the vicious rule of his sons and grandsons. Under Valdemar III (1340-75), the last of the Estridsen line, Denmark recovered for a time the conquests of the elder Valdemars, and the national laws were collected into a well-digested code. From 1375 until 1412 Valdemar's daughter, the great Margaret, ruled Denmark, at first as Regent for her young son Olaf and after his death as Queen. Denmark, Norway, and Sweden were united under her sovereignty, and this was confirmed in 1397 by the act known as the Union of Kalmar. Margaret's successor, Erik (1412-39), the son of her niece, undid her work with fatal rapidity, lost his triple kingdom, and died in obscurity. After the short reign of his nephew, Christopher of Bavaria, the Danes, on the death of the latter in 1448, reasserted their ancient right of election to the throne and chose for their King Christian of Oldenburg, a descendant of the old royal family through his maternal ancestress, Richiza, the great-granddaughter of Valdemar II. Christian I was the father of the Oldenburg line, which continued unbroken till the death of Frederick VII in 1863. Christian was chosen ruler by the estates of Schleswig and Holstein in 1460, promising for his successors that they should forever leave the two lands united. As rulers of Holstein (which was included in the Holy Roman Empire), the kings of Denmark became members of the Germanic body. Christian I's reign was followed by half a century of continuous warfare and anarchy in Scandinavia. The tyranny of Christian II (1513-23) cost him his throne. His bloody atrocities in Sweden were followed by the successful vindication of the independence of that country by Gustavus Vasa. Christian's subjects chose his uncle, Frederick I (1523-33), to be their King, while Sweden was forever separated from Denmark. Under Christian II Denmark first began to enter into extensive treaty relations with other European states. Christian III (1534-59), in whose reign the Reformation was established, united the Schleswig-Holstein duchies in perpetuity to the crown. His partition of the greater part of these provinces among his brothers became a source of much mischief. Frederick II (1559-88) further complicated matters in regard to the duchies by making additional partitions in favor of his

brother, the founder of the Holstein-Sönderburg family. He was succeeded by Christian IV (1588-1648), who was one of the ablest of Danish rulers, although his foreign wars were disastrous, while his liberal and wise internal policy was cramped in every direction by the nobles. He fought for Protestantism in Germany in the Thirty Years' War and was utterly defeated. Towards the end of his reign he engaged in an unsuccessful war against Sweden, which now became the dominant power on the Baltic. In the reign of Christian's son, Frederick III (1648-70), Denmark had to surrender all her possessions in the Swedish portion of the Scandinavian peninsula.

In 1660 Frederick III, with the assistance of the clergy and the burghers, who had joined him in opposing the pretensions of the nobles, declared the crown hereditary and the royal authority absolute and ushered in a new régime. The power of the nobility was reduced, but the peasantry and burghers profited little by the change. Many improvements were, however, effected in the mode of administering the laws, and the Danish kings, although autocrats, exercised a mild rule. The abolition of serfdom was begun in 1767 by Christian VII (1766-1808), but was not finally completed till 20 years later; it was extended to the Schleswig-Holstein duchies in 1804. The misfortunes due to the relations maintained by Denmark with Napoleon brought the country to the verge of ruin, by plunging it into war with Sweden, England, Russia, and Prussia, and although it speedily rallied from the losses inflicted in 1801 by the battle of Copenhagen, the fresh rupture with the Allies, which ended in the compulsory surrender to the English of the entire fleet, after the destructive bombardment of Copenhagen (September, 1807), completely paralyzed the nation. By the Peace of Kiel in 1814 Frederick VI of Denmark (1808-39) was compelled to cede Norway to Sweden. The discontent that had long been prevailing in Schleswig and Holstein developed after 1830 into mutual animosity between the Danish and German population. The anticipated failure of heirs to the throne complicated the questions at issue, and in 1848, immediately after the succession of Frederick VII, the German element in Schleswig and Holstein, being encouraged by the Frankfurt Parliament (which voiced the revolutionary movement in Germany), and perhaps still more by Prussia, rose in arms against Denmark. After alternate hostilities and armistices the first Schleswig-Holstein War, in which the Danish troops fought bravely against the forces of Prussia and other German states and of the rebellious duchies, terminated in 1851, Prussia having abandoned the cause of the duchies, and Austria and Prussia having intervened to restore the former order. The liberal constitution which Frederick VII had in the meantime granted to his subjects did not reconcile the Germans in Schleswig-Holstein.

On the death, in 1863, of Frederick VII, Christian of Schleswig-Holstein-Sönderburg-Glücksburg ascended the throne under the title of Christian IX (q.v.) in conformity with the act known as the Treaty of London (1852), by which the European Powers had settled the succession to the Danish crown on him and his descendants by his wife, Princess Louise of Hesse-Cassel, niece of King Christian VIII of Denmark. With Frederick VII the direct Oldenburg line had expired, and at his death the ques-

tion of the succession to the duchies acquired an importance which it had never before possessed. Schleswig and Holstein declared for Prince Frederick of Augustenburg, a scion of a branch of the Oldenburg line, and appealed to the Germanic Confederation for support. The Germanic Diet sent an army into Holstein. Prussia and Austria had in the meantime concerted with each other to take the settlement of the Schleswig-Holstein affair into their own hands. Christian IX, reflecting upon the way in which the cause of the duchies had been betrayed by the German Powers in the War of 1848-51 and relying upon the support of England, allowed himself to be dragged into a war single-handed with Prussia and Austria, whose forces advanced into Schleswig in February, 1864. After a brave but utterly futile attempt at resistance the Danes saw their country overrun by the troops of Prussia and Austria, and by the Treaty of Vienna (Oct. 30, 1864) were forced to submit to the terms exacted by their powerful foes, and resign not only Holstein and Lauenburg, but the ancient crown appanage of Schleswig into the hands of the two Powers. As a result of the War of 1866 the duchies became permanently possessions of Prussia. The record of political occurrences in Denmark after 1864 was mainly concerned with the struggle between the Conservative and Liberal parties, the rise of a powerful Democratic party, and the development of the system of parliamentary government. In 1904 a special minister for Iceland resident at Reykjavik was created. On Jan. 29, 1906, the aged Christian IX died. He was succeeded by his son Frederick VIII (q.v.), whose second son Charles had been elected in the preceding year to the throne of Norway as Haakon VII. The new King proved immensely popular with his people and by his unpretentious and democratic ways stemmed the growing tide of Danish radicalism. On May 14, 1912, while visiting Hamburg incognito, he fell suddenly dead, his body being carried to the morgue as an unrecognized man. His son succeeded as Christian X and immediately found himself face to face with a Folkething that in 1913 passed a woman's suffrage bill and a further act depriving the King of his right of nominating certain members of the national legislature.

**DENNER, BALTHASAR** (1685-1749). A German portrait and miniature painter. He was born at Hamburg and studied in Altona under Amann, in Danzig and afterward at the Berlin Academy. He is said to have painted good portraits when only 14 years of age. Rapidly acquiring reputation, he was invited to several European courts and painted the portraits of many princes and other distinguished persons of his time, including the Duke of Holstein-Got-

torp, later Czar Peter III, King Christian VI of Denmark (Museum, Christiania), the poet Hagedorn, and many of the aristocracy of England, where he lived seven years. His chief peculiarity consisted in the fineness of his mechanical finish, which extended to depicting even the almost invisible furze of hair growing on smooth skin. He is particularly noted for his heads of old men and women. The Emperor Charles VI paid 4700 florins for a "Head of an Old Woman" by this artist. This and its companion piece, the "Head of an Old Man," are in the Vienna Museum. Specimens of his art are to be found in most of the principal galleries in Europe, especially at St. Petersburg.

**DENNERY, dé'n-ré, or D'ENNERY, ADOLPHE PHILIPPE** (1811-99). A French dramatist of versatile facility, born in Paris. He wrote or collaborated in nearly 200 plays. The more noteworthy of his dramas are: *L'Honneur de ma fille* (1835); *La perle de Savoie* (1842); *La Case d'Oncle Tom* (1853), a French version of the famous American novel; *Les deux orphelins* (1873), which as *The Two Orphans*, played for many years by Kate Claxton, has been exceedingly popular in the United States. Consult Jules Lemaitre, *Opinions à répandre* (Paris, 1900).

**DENNETT, RICHARD EDWARD** (1857- ). An English writer on the peoples of Africa. He was born in Valparaiso, the son of an English clergyman, and was educated at Marlborough College. At the age of 18 he became a clerk in a mercantile house and in 1879 went to Africa on business. About 1886 he began to attack the administration of the Congo Free State and soon afterward started a manuscript newspaper called the *Congo Mirror*. His agitation led to the organization of the Congo Reform Association. In 1902 he joined the Nigerian Forest Service, of which he became deputy chief conservator. His valuable books on native life in Africa include: *Seven Years among the Fjort* (1887); *At the Back of the Black Man's Mind* (1907); *Nigerian Studies, or the Religious and Political System of the Yoruba* (1910); *West African Categories* (1912).

**DENNEWITZ, dén'e-vits.** A small village in the Province of Brandenburg, Prussia, 42 miles south-southwest of Berlin. Here was fought, on Sept. 6, 1813, a battle between 70,000 French, Saxons, and Poles, commanded by Marshal Ney, and 50,000 Prussians, under Generals Bulow and Tauenzin. The fighting was obstinate to the last degree, and both armies more than once drove each other from their positions. Ney's army was finally defeated. The French lost 15,000 killed, wounded, and prisoners, and 43 pieces of cannon. The Prussians lost about 9000. The most important feature of this victory to the Prussians was that most of their troops were *Landwehr* ('militia'), for whom Napoleon had expressed the utmost contempt, designating them as "rabble."

**DENNEY JAMES** (1856- ). A Scottish Free church theologian and New Testament scholar. He was born in Paisley and was educated at Glasgow University and at the Free Church College, where, after 11 years (1886-97) as pastor in Broughty Ferry, he became professor of New Testament language, literature, and theology. His exegetical and theological works include: *The Epistle to the Thessalonians* (1892) and *Second Corinthians* (1894) in the "Expositor's Bible"; *Studies in Theology*

(1895); *The Epistle to the Romans* (1900) in "Expositor's Greek Testament," probably his most important commentary; *The Death of Christ* (1902) and *The Atonement and the Modern Mind* (1903), perhaps his greatest theological work; *Jesus and the Gospel* (1909); *The Way Everlasting* (1911), a volume of sermons.

**DENNEY, JOSEPH VILLERS** (1862- ). An American rhetorician and university dean, born at Aurora, Ill., where, after graduating from the University of Michigan in 1885, studying law, and being engaged in newspaper work, he was principal of the high school (1888-90). He taught for a year at the University of Michigan and then went to Ohio State University to be associate professor of rhetoric (1891-94), professor of rhetoric and English literature (1894-1904), dean of the College of Arts, Philosophy, and Science (after 1901), and professor of English (after 1904). He also lectured at Columbia University in the summers of 1908 and 1911. Besides contributions to various journals, his writings include: *Burke's Conciliatory Speech* (1898); *American Public Addresses* (1909); *Four Idylls of the King* (1911); *Washington, Webster, Lincoln* (1911); *Argumentation and Debate* (1911). In collaboration with Fred N. Scott he also wrote *Paragraph Writing* (1893); *Composition-Rhetoric* (1897); *Elementary English Composition* (1900); *Composition-Literature* (1902), and with Silas B. Tobey, *English Grammar, Designed for Intensifying the Study of English Grammar in Grammar Grades* (1913).

**DENNIE, JOSEPH** (1768-1812). An American journalist, born in Boston, Mass. He graduated at Harvard in 1790, studied law at Charlestown, N. H., and was admitted to the bar. From 1795 he devoted himself mainly to literature and journalism. He edited the *Farmers Weekly Museum*, in Walpole, N. H., one of the first experiments in departmental journalism. He attained considerable reputation also as an essayist through *The Lay Preacher* (1796). In 1798 Dennie was nominated for Congress, but was defeated, and afterward went to Philadelphia as private secretary to Timothy Pickens, then Secretary of State (1799). Here he edited *The United States Gazette* and afterward established and conducted until his death *The Portfolio* (1801). This weekly became a monthly in 1806 and enjoyed high reputation. Its contributors included Broekden Brown and J. Q. Adams. Dennie wrote under the pseudonym of Oliver Old School, and he performed some service in keeping the cause of letters alive in America at a very gloomy period. His Addisonian compositions have long remained unread, but his *Portfolio* is of considerable value to students of the period.

**DENNIS, FREDERICK SHEPARD** (1850- ). An American surgeon, born in Newark, N. J. After graduating from Yale University in 1872 and from Bellevue Hospital Medical College (New York University) in 1874, he studied also in England at the Royal College of Surgeons, by which he was elected a fellow in 1899. He became consulting surgeon to several hospitals in New York and vicinity, and from 1898 to 1910 he served as professor of surgery in Bellevue Hospital Medical College. In 1894 he was president of the American Surgical Association. He edited the *System of Surgery* (4 vols., 1895-96).

**DENNIS, JAMES SHEPARD** (1842-1914). An

American Presbyterian missionary. He was born at Newark, N. J., graduated at Princeton College in 1863 and Theological Seminary in 1867, and was missionary in Syria from 1868 to 1891, during which time he was principal and professor of theology in the theological seminary in Beyrouth (1873-91). Besides several theological treatises in Arabic, he published *Foreign Missions after a Century* (New York, 1893); the very elaborate work, *Christian Missions and Social Progress* (vol. i, 1897; vol. ii, 1899; vol. iii, 1906); *Centennial Survey of Foreign Missions* (1902); and *The New Horoscope of Missions* (1908). He was also joint editor of a *World Atlas of Christian Missions* (1911).

**DENNIS, JOHN** (1657-1734). An English critic and dramatist. He was born in London and graduated at Cambridge in 1679. After further study and foreign travel he devoted himself to literature. His play, *Liberty Asserted* (1704), was received with some favor. He was best known, however, as a political and critical pamphleteer and satirist. He is one of the best-abused men in English literature. Swift lampooned him, and Pope assailed him in the *Essay on Criticism*, and finally "damned him to everlasting fame" in the *Dunciad*. Of his critical writings, the chief is *The Advancement and Reformation of Modern Poetry* (1701). Consult H. G. Paul, *John Dennis: His Life and Criticism* (New York, 1911).

**DENNIS, LOUIS MUNROE** (1863- ). An American chemist, born in Chicago. He graduated from the University of Michigan (Ph.B., 1885; B.S., 1886) and after further study abroad returned to teach chemistry at Cornell University. There he was advanced to a professorship in 1900 and to be head of the department of chemistry in 1903. Besides contributions to American and German chemical journals, he translated Walther Hempel's *Methods of Gas Analysis* (1902; new ed., 1913) and wrote *Chemical Problems in Inorganic Chemistry* (1890); *Elementary Chemistry* (1902) and *Laboratory Manual of Elementary Chemistry* (1902), with Frank W. Clarke; *Manual of Qualitative Analysis* (1902; rev. ed., 1912), with Theodore Whittlesey.

**DENNIS, WILLIAM CULLEN** (1878- ). An American lawyer, born at Richmond, Ind. He graduated from Earlham College in 1896 and from Harvard Law School in 1901. Although admitted to the bar, he did not for some years take up the practice of law, but taught this subject at the University of Illinois (1902-04), Stanford University (1904-05), Columbia (adjunct professor, 1905-06), and George Washington University (professor, 1906-09). From 1906 to 1910 he was also assistant solicitor of the United States Department of State; he represented the United States in the matter of the Venezuela Arbitration, before The Hague Tribunal (1909-10) and in the Chamizal Arbitration with Mexico, before the International Boundary Commission (1910-11); and he acted as secretary to the Chief Justice of the United States in the Panama-Costa Rica Boundary Arbitration. He took up private law practice in 1911 at Washington, D. C.

**DENNISON, A** village in Tuscarawas Co., Ohio, 100 miles northeast of Columbus, on the Pittsburgh, Cincinnati, Chicago, and St. Louis Railroad and on the Panhandle Ohio Canal (Map: Ohio, H 5). The village contains a hospital and public library and has railway work-

shops and sewer-pipe works. Under the Ohio code in 1902 the government of Dennison is vested in a mayor and a unicameral council. Pop., 1900, 3763; 1910, 4008.

**DENNISON, WALTER** (1869- ). An American Latin scholar, born at Saline, Mich. He graduated in 1893 from the University of Michigan, where, after studying at the University of Bonn and at the American School of Classical Studies, Rome, he was instructor (1897-99) and junior professor of Latin (1902-10). He also held professorships at Oberlin College (1899-1902) and at the American School of Classical Studies, Rome (1908-09). In 1910 he became professor of Latin and Greek at Swarthmore College. Besides revising Kelsey's *Topical Outline of Latin Literature* (1899) and Frieze's *Virgil's Æneid* (1902), he is co-author with John C. Rolfe of *A Jumor Latin Book* (1898; rev. ed., 1911), and he also edited *Livy, Book I, and Selections from Books II-X* (1908).

**DENNISON, WILLIAM, JR.** (1815-82). An American politician. He was born in Cincinnati, graduated at Miami University in 1835, and practiced law until 1848, when he was elected to the State Legislature. He was Governor of Ohio from 1860 to 1862 and in answer to a call for 11,000 troops raised more than 30,000. From 1864 until his resignation in 1866 he was Postmaster-General in the cabinets of Presidents Lincoln and Johnson. One of the earliest prominent politicians who joined the Republican party, in 1864 he was chairman of the Republican National Convention. He was a benefactor of Dennison University (Granville, Ohio).

**DEN'NY, SIR ARCHIBALD** (1860- ). A British marine engineer, born in Dumbarton, and educated there, at the Ecole Cantonal of Lausanne, and the Royal Naval College, Greenwich. He worked in the Leven shipyard and in 1883 joined the firm of William Denny & Brothers, prominent at Dumbarton since the middle of the century. He is an influential member of the Institution of Naval Architects and served on important committees of the British Corporation for the Registration of Shipping. He wrote professional papers for the Institution of Naval Architects.

**DENNY, GEORGE HUTCHESON** (1870- ). An American Latin scholar and university president, born in Hanover Co., Va. He graduated from Hampden-Sidney College in 1891 and received the degree of Ph.D. from the University of Virginia in 1896, was professor of Latin and German at Hampden-Sidney for three years, and was then called to Washington and Lee University to be professor of Latin, acting president, and (1902-11) president. In 1911 he became president of the University of Alabama. He was president of the Southern Association of Colleges and Preparatory Schools (1905) and of the Coöperative Educational Association of Virginia (1903-12) and chairman of the Virginia State Board of Charities and Corrections (1908-11). He was also chosen (1905) a trustee of the Carnegie Foundation for the Advancement of Teaching. He edited *Cicero's Letters* (1901), contributed "The South in the Building of the Nation" in the *Library of Southern Literature*, and wrote *The Subjunctive Sequence after Adjective and Substantive Predicates and Phrases* (1896).

**DENON, de-nôn'** DOMINIQUE VIVANT, BARON

VOL. VI.—44

(1747-1825). A French draftsman, art collector, and writer. He was born at Givry, near Châlons-sur-Saône, Jan. 4, 1747, and came early to Paris. While studying law, he wrote extensively, studied drawing with Noël Hallé, and became a great favorite in aristocratic society. Louis XV made him an attaché to the embassy at St. Petersburg and afterwards Ambassador to Switzerland. Here he repeatedly visited Voltaire at Ferney and painted his portrait and made the drawing "Déjeuner de Ferney" after which the well-known print was engraved. During his seven years' stay with the French embassy in Naples he collected works of art, reproduced the old masters, etched portraits of his contemporaries, and in conjunction with the Abbé Saint-Non published the *Voyage pittoresque de Naples et de Sicile* (1788). He returned to France during the Revolution and was saved from the guillotine by the painter David, for whom in gratitude he etched the "Oath of the Jeu de Paume." He was chosen by Napoleon to accompany the expedition to Egypt in the capacity of a savant and in 1802 published his *Voyage dans la Basse et la Haute Egypte*, the engravings of which are very correct. Napoleon made him inspector general of museums, in which capacity he showed great ability. He accompanied the Emperor on various subsequent expeditions and suggested to him what art treasures of the conquered cities would be most suitable for the Louvre. After the restoration of the Bourbons he was dismissed from his office. The remaining years of his life were occupied in arranging his private collection and designing the illustrations for a history of art the text of which was furnished by Amaury Duval and published in 4 vols. (1829), under the title *Monuments des arts du dessin chez les peuples tant anciens que modernes*. Denon himself executed more than 300 etchings, which were published in *L'Œuvre originale de Vivant Denon* (1872-73) with introduction by La Frizelère. He designed most of the Napoleonic medals and coins and was one of the first to introduce lithography into France.

**DENOTATION** (from Lat. *denotare*, to mark out, from *de* + *nota*, mark). In logic, the group of objects of any one of which any term with a definite meaning can be predicated. Thus, every individual horse, past, present, and to come, is part of the denotation of the term "horse." Denotation and connotation (q.v.) are said to vary inversely, because, in general, with the increase of attributes in the connotation, the objects in the denotation are reduced. The number of bay horses is smaller than the number of horses in general; but the number of qualities connoted by "bay horse" is larger than that connoted by "horse." A particular color is included in the former connotation which is not included in the latter. Synonyms of denotation are extension, sphere, breadth. See LOGIC.

**DÉNOUEMENT, dá-nōō'mân'** (Fr., an un-knotting). In fiction, a term generally applied to the termination or catastrophe of a play or romance. More strictly speaking, it designates the train of circumstances unraveling the plot and hastening the catastrophe. A good dénouement in a novel or play should follow naturally from the plot without being so obvious as to be easily anticipated.

**DENS, PETER** (1690-1775). A Roman Catho-

lie theologian, born at Boom, in Belgium. He was reader in theology at Mechlin for 12 years and president of the College of Mechlin for 40 years (1735-75). He was also canon, penitentiary, synodical examiner, and archpriest of St. Rombold's—the metropolitan church at Mechlin. The work by which he is best known is the *Theologia Moralis et Dogmatica* (new ed., 8 vols., Dublin, 1832), published under his name in 1777. It is a systematic exposition and defense—in the form of a catechism—of every point of ethics and doctrine maintained by Roman Catholics and has been extensively adopted as a textbook in their colleges. The casuistical parts of the work have been severely criticized by Protestant moralists and were translated in a condensed form by J. F. Berg (Philadelphia, 1840).

**DENSITY.** See SPECIFIC GRAVITY; MOLECULES—MOLECULAR WEIGHTS; VAPOR.

**DENT, FREDERICK TRACY** (1820-92). An American soldier, born in White Haven, Mo. He graduated at West Point in 1843, was assigned as brevet second lieutenant to the Sixth Infantry, served in the Southern campaign during the Mexican War, and was brevetted first lieutenant and captain for gallant and meritorious conduct at Contreras and Churubusco and at Molino del Rey respectively. He served for 16 years on frontier duty, taking part in the Yakima expedition, and in 1863 was promoted to be major and was stationed in New York to suppress anticipated riots. In 1865 he was brevetted brigadier general of volunteers and in 1866 was made brigadier general of volunteers. In 1873 he served on the staff of the general in chief. He commanded Fort Trumbull, Conn., in 1875 and the post of St. Augustine in 1881. He retired in 1883. His sister Julia married his West Point classmate U. S. Grant and became the mother of Frederick Dent Grant.

**DENT, JOHN CHARLES** (1841-87). A Canadian journalist and historian. He was born at Kendal, England, was brought by his parents to Ontario during infancy, and was educated at the public schools. He studied law and was called to the bar in 1865, but after practicing his profession for a brief period went to England and became an editorial writer on the *Daily Telegraph*. In 1867 he returned to America and did newspaper work in Boston for three years and in 1870 went to Toronto to join the editorial staff of the *Globe*. He relinquished journalism after a few years to devote himself to historical investigation. His works are: *The Canadian Portrait Gallery* (1880), a series of biographical and historical studies which he edited and mostly wrote; *The Last Forty Years: Canada since the Union of 1841* (1881); *Rev. Henry Scadding: A Memorial Volume* (1884); *The Story of the Upper Canada Rebellion* (1885-86). In literary style, grouping of events, and political analysis Dent's books are a distinct advance beyond histories of Canada previously published in English. His writing is brilliant, lucid, forceful; his method such as to leave a clear and abiding sense of the relative importance of different phases of Canadian development. He was a painstaking and conscientious investigator, fearless in his conclusions, and his treatment of the political crises between 1841 and 1880 is, on the whole, impartial. This can scarcely be said of his estimate of the two leading characters in

the Upper Canada Rebellion of 1837-38. He was biased against William Lyon Mackenzie (q.v.) and unduly praised John Rolph (q.v.); nevertheless the main features and issues of that contentious period are faithfully delineated. Consult: Marquis, "English-Canadian Literature," in *Canada and its Provinces*, vol. vi (Toronto, 1914); Casgrain, "Etude critique," in *Transactions of the Royal Society of Canada* (Ottawa, 1884); King, *The Other Side of the Story of the Upper Canadian Rebellion* (Toronto, 1886).

**DENTAL FORMULA.** A formal statement of the number and arrangement of the teeth. See TEETH.

**DENTALS** (Neo-Lat. *dentalis*, from Lat. *dens*, tooth). A name given to sounds formed or pronounced against or near the front upper teeth with the tip or front of the tongue, such as *d*, *t*, *th*, *l*, or *n*. This term is very imperfect, as the teeth bear no important part in the production of the sounds in question and sometimes, as in the English pronunciation of *l* and *n*, no part at all. For this reason phoneticians attempt often to avoid the term, substituting lingual, tongue point, lateral (for *l*), or the like.

**DENTATUS, MANIUS CURIUS.** A Roman eminent for his warlike exploits and the republican simplicity of his life. In his first consulship he triumphed over the Samnites and the Sabines (290 B.C.); by defeating the Samnites he ended a war that had lasted 50 years. During his second consulship (275) he defeated Pyrrhus, near Beneventum, and drove him from Italy. In 272 he became censor. On one occasion a Sabine embassy, sent to his farm with gifts, found him roasting turnips at the hearth. Rejecting the gifts, he declared that he preferred rather to rule those possessing gold than himself to possess it. It was he who, to drain the Valley of Reate, dug the canal from Lake Velinus to the river Nera, where it falls in the well-known cascade of Terni (q.v.). Pliny, *Historia Naturalis*, 7, 68, says his cognomen (q.v.) "Dentatus" was due to the fact that when he was born his teeth were already grown.

**DENTICE** (Lat. *dentix*, a kind of sea fish; from *dens*, tooth, on account of its voraciousness). A fish of the genus *Dentex*, family Sparidae (sea breams, etc.), having a deep, compressed body and generally perchlike form; a single dorsal fin, the anterior rays of which are spinous; scaly cheeks, and large canine teeth. One species (*Dentex vulgaris*), "dentix" of the ancient Romans, abounds in the Mediterranean and attains 20 to 30 pounds' weight. It is excessively voracious, devouring other fishes, but is itself in much request as an article of human food, and great numbers are taken in southern Italy and in Dalmatia and the Levant, where it is a considerable article of commerce, being cut in pieces and packed in barrels with vinegar and spices as well as served fresh.

**DENTIFRICE**, *dén-ti-fris* (Lat. *dentifricium*, tooth powder, from *dens*, tooth + *fricare*, to rub). Any substance, generally a powder, which is employed as an aid in cleaning the teeth. Charcoal and cuttlefish-bone powder are useful as detergents; chalk, as a soft powder; and pumice, as a hard, gritty substance for occasional use, when the teeth are more than ordinarily discolored. Catechu, cinchona, and rhatany are employed to give astringency to the tooth powder; myrrh, to impart odor; and

bole armeniac, to communicate a red color. Common salt, cream of tartar, phosphate of soda, and sulphate of potash are occasionally used; and where the breath has an unpleasant odor, the addition of four parts of bleaching powder (chloride of lime) to 100 of the tooth powder removes the fetid character of the breath and also tends to whiten the teeth. An excellent mouth wash may be prepared by adding to a tumblerful of water 10 or 15 drops of a mixture containing equal parts of carbolic acid and essence of peppermint.

**DENTILS** (Lat. *denticulus*, dim. of *dens*, tooth). A series of small blocks, arranged in a row closely serrated, especially under the corona in a classical cornice. They are used in the Greek Ionic and Corinthian orders and by the Romans also in the Denticulated Doric, Corinthian, and Composite orders. See ENTABLATURE.

**DENTINE**, dên'tin (Fr., from Lat. *dens*, Eng. *tooth*). The tissue forming the principal mass of the teeth. It is a modification of osseous tissue, but differs from this in its structure and chemical composition. Microscopical examination shows numerous minute branching tubules embedded in a dense intertubular substance and opening into the cavity of the tooth, which contains the pulp. Externally the crown of the tooth is covered by a thin layer of enamel, which is extremely hard and compact.

**DENTIROSTRES**, dên'ti-rôs-trêz (pl. of Neo-Lat. *dentirostris*, from Lat. *dens*, Eng. *tooth* + *rostrum*, beak, bill). A term no longer in use, formerly designating an artificial group of birds, mostly insectivorous, having a notch and "tooth" in the margin of the upper mandible.

**DENTISTRY**. The science of diseases or lesions of the teeth and adjacent organs, and the art of making and inserting appliances for the correction of loss, deformity, injury, or malposition of those organs. The two main branches of dentistry are prosthetic or mechanical dentistry, sometimes called prosthodontia, and operative or surgical dentistry. It is not easy to draw a distinct line of demarcation between these two branches, for much of the work considered to be in the province of the operative department is really prosthetic or mechanical and vice versa. Prosthesis in its surgical sense has been defined to be "the addition of an artificial part to supply a defect of the body." Many of the conditions about the mouth which call for treatment require on the part of the dentist an intimate knowledge of both branches, and the treatment is both prosthetic and operative. The operation of filling teeth, and also the insertion of inlays, although generally considered as belonging to the department of operative dentistry, are to a certain extent prosthetic, since they supply artificial substitutes for lost natural parts. Under the head of operative dentistry come also the operations of extracting teeth, implantation, replantation, transplantation (see below), removal of deposits from about the teeth, and the treatment of the various diseases or injuries of the dental organs or their surroundings. The making of artificial dentures, crowns, bridgework, obturators, and artificial vela is prosthetic; but the adjustment of such appliances, or perhaps the preliminary treatment, may require no small amount of surgical

knowledge and skill. The operative dentist must also to a certain extent be qualified as an oral surgeon, in order that he may treat some of the ordinary diseases or injuries which may affect the mouth or maxillary bones. The correction of irregularities of teeth and the making of appliances for the purpose are largely mechanical, and for that reason usually classed under the head of prosthetic dentistry. Strictly speaking, however, the operation is not a prosthetic one, and many prefer to class this as a third branch or subdivision of dentistry, calling it orthodontia, and the operator an orthodontist.

As a distinct profession, dentistry has only developed during the past century. Prior to that period, so far as we can determine, it existed only as a somewhat unimportant branch of the healing art; and some of the operations now considered to belong only to the domain of dentistry were then performed by the medical practitioner, or perhaps by some artisan who made claim to a certain amount of proficiency in the performance of such operations. The time is not so long passed since it was not unusual for the barber or blacksmith to extract teeth and to receive a fee therefor, nor since it was customary for the silversmith or jeweler to make artificial dentures.

Certain branches of dentistry were practiced long before the modern profession came into existence, and dental operations were performed early in the history of civilized nations. The wearing of false teeth must have been common in Rome in the time of Martial, who frequently ridicules them. One couplet runs:

"False teeth and hair flaunts Lælia shamelessly,  
But not false eyes, for these she cannot buy."

The Romans probably acquired their dental knowledge from the Etruscans, and the Etruscans and Greeks from the Egyptians. Specimens of dental work in the shape of natural teeth bound together with gold, or artificial teeth of ivory, bone, wood, or stone, attached to the natural ones by means of cord, or gold or silver bands or ligatures, have been found in the jaws of mummies, which were probably buried 500 or 600 years before the Christian era; but, so far as we know at present, there are no authentic examples of tooth filling of equal antiquity. In writings upon the subject of dentistry the statement is not infrequently made that teeth of mummies have been found filled with gold. But, according to the researches of Van Mater and others, the truth of such statements is certainly to be questioned. Van Mater, who had unusually good opportunities for archaeological investigation, asserts that in his careful study of the teeth of many of the remains taken directly from excavations of ancient tombs in Italy, and also of the teeth of mummies in various museums and private collections, he was unable to find a single example of a gold filling in such teeth. The results of his investigations seem to show that cases hitherto supposed to be examples of gold filling were nothing more or less than specimens of bridgework, or perhaps the banding of teeth with gold for the support of loose ones or to hold artificial teeth in place. Many of the specimens found were so covered with the accumulated dust of centuries that it was impossible, before removing some of that accumulation, to tell whether they were examples of gold fillings in the teeth or gold bands about

the teeth. It is well known that the higher orders of Egyptians often caused the mummies of their deceased friends and relatives to be lavishly decorated with paint and gilding, and in several instances the supposed gold fillings in the mouths of Egyptian mummies have, on mere scratching with a knife, proved to be nothing but superficial gilding on the natural teeth.

References to dental operations are found in the writings of Herodotus and Hippocrates in the fifth century B.C. Aristotle wrote on this subject about 350 B.C., and Heraclides of Tarentum, Herophilus, and Erasistratus are recorded as dental operators three centuries before our era. According to the writings of C. Aurelinus, Erasistratus deposited in the temple of the Delphian Apollo a leaden "odontogogue" (forceps), "to prove that [only] those teeth ought to be removed which are loose or relaxed, and for which a leaden instrument will suffice." Celsus, who lived about 100 B.C., was the first to recommend the use of the file in the mouth, saying that the points of a decayed tooth, which hurt the tongue, should be removed with an iron file. Horace (65 to 8 B.C.), Ovid (43 B.C. to 17 or 18 A.D.), Martial (c.43-104 A.D.), already quoted, and other of the ancient Greek and Latin poets, allude in their writings to artificial teeth, as does Cicero. The further history of dentistry is meagre and uncertain. Before the invention of printing the methods of recording and transmitting knowledge were so laborious and expensive that only matters of great importance were transcribed, while other matters, of lesser importance, were transmitted and preserved only by word of mouth. Thus, the early history of the profession is imperfect and uncertain. The oldest printed book known to dental bibliography is one dated 1532, printed in German by Peter Jordan and containing extracts or quotations from the works of Galen, Avicenna, Mesua, Cornelius, Pliny, and others. This book was written for lay readers by an anonymous writer, and in the chapter treating of decay of the teeth the author, quoting from Mesua, advises, as one method of treatment, first to scratch and clean with a fine chisel, knife, file, or any other suitable instrument, the parts attacked, and then to fill the cavity with gold leaves for the preservation of the remaining parts of the tooth. If this quotation is reliable, the operation of filling teeth with gold must have been known more than 1000 years ago. Galen (150 A.D.) treated the subject of the teeth more extensively than any other of the ancient authors, and his writings on that topic were the best up to the time of Fallopius, Eustachius, and Ambroise Paré in the sixteenth century. Fauchard wrote on dentistry in 1728, and Bourdet in 1757. John Hunter in 1771 published his *Treatise on the Natural History of the Human Teeth*, and in 1778 A *Practical Treatise on Diseases of the Teeth*, as a supplement to his former work. Not being a dental specialist, however, he wrote anatomically and philosophically rather than practically. Woodfendale's *Practical Observations on the Human Teeth* was published in London in 1783. Blake wrote on dentistry in 1798 or 1801. Since the beginning of the nineteenth century a considerable amount of original research has been carried on in all branches of dental science, and a large and increasing number of treatises have been devoted to dentistry exclusively.

**Histology and Development.** The microscope has done much to improve the practice of modern dentistry. Leeuwenhoek was the first to give an intelligent idea of the histological structure of the teeth (c.1682). The main work, however, on the embryology, histology, and pathology of the teeth was done during the nineteenth century. The first rational theory of the evolution of the teeth was advanced by Goodsir in 1837. In 1860 Robin and Magitot brought forth a better theory in regard to the mode of development of the teeth, and their theory, with very little modification, is accepted at the present time. See **TEETH**.

**Artificial Dentures.** Prior to the discovery of the method of making porcelain teeth the dentist made use of human teeth, animal teeth (those of cattle and sheep), hippopotamus tusks, elephant and other ivories, and bone. The human and animal teeth were fastened in the mouth by ligatures of gold or silver wire, unbleached thread, sea grass, or silkworm gut. The hippopotamus or elephant ivory, or the common bone, was carved in single teeth or blocks, and perhaps in the shape of full or partial dentures, to replace the lost natural teeth. The objections to this method of restoration were the difficulty of getting accurate adaptation in the mouth and the tendency, because of the porosity of the material, to absorb moisture, to become offensive, and ultimately to decay. The use of porcelain as a material for artificial teeth was first proposed by Fauchard in 1728; but the manufacture of porcelain teeth was first actually begun by Duchateau, a French chemist, assisted by Dubois, a dentist of Paris, somewhere between 1774 and 1776. The date of the introduction of metal bases in prosthetic dentistry is not definitely known. It is believed, however, that gold was the first metal used as a base for artificial teeth, and that Dr. Gardette, of Philadelphia, was the first to use the gold base in this country, in or before 1787. Among the other metals which have been used as bases for artificial dentures are silver, platinum, aluminum, tin, and various metallic alloys; but at the present time gold and platinum are the only metals in general use for that purpose. *Gutta-percha* as a base was introduced in England by Edwin Trueman about 1851. In 1851, also, Nelson Goodyear discovered a method of making a hard rubber compound, since named *vulcanite*, and in 1855 Charles Goodyear, Jr., obtained a patent in England for making a dental plate of hard rubber, in which the teeth were secured before the compound was vulcanized. *Rose pearl*, a preparation of collodion, was next experimented with as a base, but, owing to the difficulty of manipulating it and to its lack of durability, it fell into disuse. *Celluloid* was the next material tried, but, being more porous and less durable than vulcanite, it is seldom used at present. *Porcelain* and a combination of platinum and porcelain have been used as bases for artificial dentures. Porcelain alone did not come into general use because of the difficulty of manufacture, brittleness, and danger of shrinkage or warping during the process of firing. The combination of *porcelain and platinum* (continuous gum) is made as follows: A base of platinum is swaged to fit the mouth, the artificial teeth are lined with metal and soldered to the platinum base; a porcelain body of the proper shade is next molded about

the necks and root portion of the artificial teeth, as well as upon the exposed surfaces of the platinum, and carved and colored to imitate the natural mucous membrane of the mouth; the entire piece is then put in an oven and baked long enough and often enough to fuse the porcelain properly. This method of inserting artificial teeth is one of the best at our command, so far as beauty, cleanliness, durability, and correct imitation of nature are concerned.

**Crown and Bridge Work.** Modern bridge work (or the insertion of artificial teeth by means of bands, springs, or artificial crowns attached to the crowns or roots of natural teeth) is but a modification of methods pursued by the ancients many centuries before the Christian era. The use of bridges is not infrequently carried to extremes, and bulky bridges are sometimes attached to teeth which are incapable of bearing the strain for any length of time. Poorly made or improperly adapted bridges are frequently inserted and are prolific sources of pollution of the secretions of the mouth; and some cases of movable or immovable bridges require considerable sacrifice of natural tooth structure, or perhaps devitalization of the pulp, in order that the bridge may be properly adjusted. It is sometimes a difficult matter to determine the best means of restoration or prosthesis in these cases, but the conservative dentist will hesitate, and perhaps prefer a partial denture, rather than resort to the sacrifice of those tissues for the sake of introducing a bridge.

Gold shell crowns, for the purpose of covering teeth too badly broken down to be amenable to the operation of filling, are supposed to be of quite recent invention, but it is claimed that their use was suggested by M. Mouton, of Paris, as far back as 1746. It is said also that Mouton advised enameling the exposed surfaces of such crowns. Gold crown work has been abused even more than bridge work, and we frequently find gold crowns placed on the anterior teeth to protect them when injured or diseased, or to serve as abutments for bridges when crowns of porcelain or porcelain-faced crowns would answer the purpose as well and be much more sightly. Many patients will insist on a dentist placing a gold cap or shell crown on a tooth, when a filling of some sort would be very much better and much more artistic. Fortunately the laity, as well as the dentist, are beginning to appreciate the enormity of this offense against good taste.

**Fillings, etc.** The filling of teeth is now sometimes called *obturation*. Before the introduction of gold leaf foil was used as the material for filling teeth. Celsus (100 B.C.) is sometimes referred to as the first to have advised filling cavities in teeth; but the only reference to the subject in his works is his recommendation to stuff with lead decayed and frail teeth that are to be extracted, in order that they may not break under the forceps. Tooth filling proper was, up to the beginning of the nineteenth century, practiced very seldom. The operation of filling teeth with gold was mentioned by Fauchard (died 1761). For years gold was used in the form of thin foil or rolled gold of the noncohesive variety. Sponge or crystal gold was introduced in 1846, but was little used until its application to dental purposes was patented, and its working quality

improved by A. J. Watt, of Utica, N. Y., in 1853. In 1855 Dr. Arthur, of Baltimore, recommended the use of cohesive gold for filling teeth, and this variety is more used at present than any other. The use of mallet force in filling teeth with gold was first recommended by Dr. William H. Atkinson, of New York. Platinum has been tried as a filling material, but was found to be too harsh and to have too little ductility and plasticity to make it valuable for that purpose. It is sometimes used in combination with gold foil or rolled gold for a filling exposed to severe stress. Silver is not used alone for fillings because of its tendency to oxidize and because of its stiffness and want of ductility. Tin, in the form of foil, has been used for filling teeth since 1783 and is still used for certain kinds of cavities. The advantages of tin are that it is soft, pliable, easily condensed and adapted to cavity walls, a poor conductor of heat, and, in cases of disintegration, yields salts that seem to possess antiseptic properties. Yet its softness, its almost complete lack of cohesiveness, its property of becoming discolored in the mouth, and its disintegration under chemical and mechanical influences, also constitute serious disadvantages.

Owing to the difficulties in properly manipulating the simple metals in filling teeth, efforts were early made towards discovering some material of greater adaptability, and, as a result, we have the plastics so extensively used at the present day. The earliest of these materials were preparations of the gum resins, such as ethereal or alcoholic solutions of mastic, sandarac, damar, or copal. Then fusible metals were employed, until, in 1826 or thereabouts, Taveau, of Paris, introduced the use of *amalgams*. An amalgam is a combination of one or more metals with mercury, and that first tried was an amalgam of pure silver. The next amalgam to be used was one of coin silver. The amalgams as made at present usually consist of a combination of three or more metals with mercury. Such amalgams, manipulated by improved modern methods, constitute the only plastics that can be considered as permanent filling materials. The other plastics used at present include: gutta-percha (introduced in 1847-48); "Hill's stopping" (a mixture of gutta-percha with harder materials); oxychloride of zinc (oxide of zinc, with a solution of zinc chloride); zinc phosphate (oxide of zinc, with a solution of phosphoric acid); oxyphosphate of copper; aluminum phosphate; oxysulphate of zinc; and other varieties of the cements. Each of these cements has its definite uses and advantages, but all have the disadvantage of serving only as temporary fillings.

The *filling of pulp canals* in devitalized teeth was believed to have been introduced by Maynard and Baker, of Washington, D. C. It has been shown, however, that this operation was practiced by Bourdet and Fauchard, in Paris, as far back as the middle of the eighteenth century and, according to Bourdet, had been practiced by others many years before. The *capping* (covering over) of *exposed pulps* is said to have been first recommended by Koecker. The *dental engine*, in its original form, was introduced by Dr. Morrison, of St. Louis, Mo., in 1846; in its various improved forms it has become one of the most useful of dental appliances. The use of the *rubber dam* for the

purpose of excluding moisture from cavities during the operation of filling teeth was first suggested by Dr. S. C. Barnum, of New York, and this innovation has been as great a boon to dentistry as the introduction of the Esmarch bandage has been to general surgery.

**Inlay Work.** One of the latest innovations in the art of dentistry is inlay work, i.e., the use of plugs of porcelain, glass, gold, vulcanized rubber, and similar materials, which are cemented into a tooth cavity in such form and shape as to fit it exactly. With the improved methods and materials for making porcelain inlays this mode of filling carious cavities is becoming more and more popular, and when perfected will undoubtedly cause the abolition of gold fillings in the anterior teeth. It may be interesting to observe that inlays of green jade, placed in the teeth probably for ornamentation, have been found in the ruins of Copan, Honduras, and of Yucatan.

**Uses of Electricity.** Electricity has its practical applications in dentistry as well as in the arts and is utilized not only for the control of various mechanical appliances employed by the operative and prosthetic dentist, but in the form of the electric mouth lamp; the cataphoric current, etc., is used for diagnostic and therapeutic purposes as well. *Cataphoresis*, or the method of forcing drugs into the tissues by means of the galvanic current, was first proposed by Dr. B. W. Richardson as far back as 1857, but has come into general use only within recent years. The X-rays, or Roentgen rays, are now put to practical use in dental as well as in general surgery and as a means of diagnosis are sometimes of very great assistance. For the purpose of detecting unerupted or impacted teeth, abnormal growths on or about the teeth, imperfect root-canal fillings, resorption of roots, fractures of the jaw, or the presence of foreign bodies in the alveoli of the teeth, the X-rays are of great value and frequently utilized.

**Treatment of Loose Teeth.** The teeth frequently become loosened from their attachments in consequence of local or constitutional disturbances, and the treatment of this condition is still a somewhat knotty problem. When due to local causes, such as deposits of salivary calculus, or ordinary tartar, the treatment is principally local, and consists in first removing the deposits, getting the teeth as smooth as possible, and then adopting proper therapeutic and prophylactic measures, with a view to inducing a healthy condition of the soft tissues and preventing a return of the deposit. The constitutional cause, which is more often concerned than any other in bringing about the loosening of teeth, is the so-called "gouty" or "rheumatic" condition. In cases of this nature the treatment should be both local and constitutional or general.

**Replantation; Transplantation; Implantation.** *Replantation*, or the replacing of a natural tooth in the socket from which it has been extracted or forced out, is a very old operation, and its definite history is unknown. *Transplantation*, or the placing of a natural tooth in a natural socket other than the one it originally occupied, is also an old operation and was spoken of by Ambroise Paré in the sixteenth century. In this operation it was customary to use a freshly extracted tooth from the mouth of one person and place it in the socket of a

newly extracted tooth in the mouth of another. In an advertisement inserted in a Philadelphia paper in 1784 Le Mayeur, a dentist, offers two guineas each for sound teeth to be obtained from "persons disposed to sell their front teeth, or any of them." *Implantation*, which may be defined to be the placing of a natural or artificial tooth in an artificially prepared socket, or the insertion of an artificial tooth in a natural socket, was suggested by Dr. William Younger, of San Francisco, Cal., in 1885; but it is asserted that Bourdet, in 1780, advised a similar operation. In the Peabody Museum, at Cambridge, Mass., there is a jaw, discovered in the ruins of Copan, Honduras, wherein is implanted (in the socket of a left lower lateral incisor) an artificial tooth of carved stone, which from the amount of tartar on it would indicate a considerable amount of use in the mouth of the individual. The exact age of those ruins is unknown, but this specimen of implantation probably antedates Dr. Younger's operation by about 1500 years. Experience has shown that implanted teeth are short-lived, so far as their usefulness goes. After a period varying from 2 to 10 or 12 years the implanted teeth almost invariably loosen and fall out, because of absorption of the roots when natural teeth are used, and incompatibility when artificial roots are inserted. In many cases of implantation the operation is unsuccessful from the start, and no union is obtained; in others a slight attachment seems to occur between the tooth and alveolus, which gives out after a few weeks or months; while in a fair percentage of cases the teeth may become firmly attached and remain for several years. As a rule, they seldom remain longer than three or four years and are much shorter-lived than replanted or transplanted teeth.

**Anæsthetics.** The action and history of the use of anæsthetics may be found described in the general article ANÆSTHETIC, and in a number of special articles on the more important anæsthetic substances in use at present. Here it may be stated that, while chloroform and ether were much used in dentistry formerly, practically the only general anæsthetic employed by dentists at present is nitrous oxide, or "laughing gas." The only local anæsthetic now used in dentistry to any extent is cocaine, which has almost entirely superseded the use of cold-producing volatile substances, like ordinary ether, ethyl chloride, or rhigolene.

**Orthodontia.** Orthodontia, or the art of regulating or correcting malpositions of teeth, has recently developed into a distinct specialty, although some attention has been given to it by dentists ever since the latter part of the eighteenth century. At the present time some operators devote their whole attention to this branch of practice, and the results obtained by those who have the necessary mechanical ingenuity and diagnostic ability are extremely gratifying.

**Dentists.** Woodendale, who came to America in 1766, seems to have been the first regular dental practitioner in the United States. Le-maire came to America probably in 1784. James Gardette, a native of France, began practice in the United States in 1781. He went to Philadelphia in 1784 and continued in successful practice there for 45 years. Josiah Flagg, who, as far as can now be accurately determined, was the first dentist native to the United States, began practice in 1782. He obtained his knowledge of

dentistry from Lemaire. Isaac Greenwood, the father of the John Greenwood who made sets of artificial teeth for George Washington, was probably the first dentist in Boston. John Greenwood and his younger brother, Clark, were in practice in New York about 1784. The increasing growth of the profession since 1820 is shown by the following figures: in 1820 there were about 100 dentists in the United States; in 1872 the number had increased to 5000; in 1893 the number was 13,500; in 1898, 18,000; in 1900 the number in the United States and Canada was 26,500; in 1902 the United States and Canada had over 27,600 dentists, of which number 16,390 were graduates of regular dental colleges.

**Literature.** L. and M. Greenbaum, *A Practical Treatise upon the General Practice of Dentistry* (New York and London, 1912); Richardson, *A Practical Treatise on Mechanical Dentistry*, ed. by Warren (Philadelphia, 1900); Kirk, *American Text-Book of Operative Dentistry* (ib., 1911); Dexter, *History of Dental and Oral Science in America* (ib., 1876); Brownell, *Anatomy and Histology of the Mouth and Teeth* (2d ed., ib., 1902); Burchard, *Text-Book of Dental Pathology* (2d ed., ib., 1914); Jackson, "Orthodontia and Orthopædics of the Face" (ib., 1904); Lischer, *Principles and Methods of Orthodontics* (ib., 1912); Guerini, *A History of Dentistry* (ib., 1909). See **TEETH**.

**DENTITION.** See **TEETH**.

**DENTON.** A city and the county seat of Denton Co., Tex., 35 miles north by east of Fort Worth, on the Missouri, Kansas, and Texas and the Texas and Pacific railroads (Map: Texas, D 3). It is the seat of the North Texas State Normal College and the College of Industrial Arts, and it contains a sanitarium. Denton trades extensively in cotton, wheat, corn, and cattle. The water works, electric-light plant, and sewage system are owned by the municipality. Denton was first settled in 1857 and incorporated in 1868. Pop., 1900, 4187; 1910, 4732.

**DENTON** (Danetown). A manufacturing and coal-mining town in Lancashire, England, 2½ miles southwest of Ashton. It owns remunerative municipal gas works. Reservoirs of 1,860,000,000 gallons' capacity, which supply water for Manchester, are within the township. Pop., 1901, 14,934; 1911, 16,880.

**D'ENTRECASTEAUX ISLANDS**, dān'tr-kās'tō' (named in honor of their discoverer, Joseph Antoine d'Entrecasteaux). A group of islands, about 10 miles off the east coast of New Guinea, lying in lat. 10° S. (Map: East India Islands, J 2). They consist of three large islands, viz., Ferguson, Normanby, and Good-enough, and a number of islets, with a total area of about 1200 square miles. They are very mountainous, some peaks attaining the height of 7000 feet. Extinct volcanoes and hot springs are found on Ferguson Island. Tin and traces of gold have been discovered. In 1885 the group became a part of the administrative dependency of British New Guinea, which, by proclamation in 1906, was renamed the Territory of Papua. The inhabitants are Papuans.

**DENUDATION.** See **EROSION**.

**DENVER.** The capital of Colorado, the county seat of Denver County, and the largest city between the Missouri River and the Pacific Ocean. It is situated at the junction of the South Platte River and Cherry Creek, 2025 miles

from New York City and 1457 miles from San Francisco, in lat. 39° 47' N., long. 105° W. (Map: Colorado, E 2). It is one of the most important railroad centres in the West. Among the numerous lines entering the city are the Atchison, Topeka, and Santa Fe, the Chicago, Burlington, and Quincy, the Chicago, Rock Island, and Pacific, the Colorado Midland, the Denver and Rio Grande, the Missouri Pacific, the Union Pacific, the Colorado and Southern, and the Denver, Northwestern, and Pacific. The city is magnificently situated at an altitude exactly 1 mile above sea level and within 15 miles of the eastern base of the Rocky Mountains. Owing to the remarkable clearness of the atmosphere, a stretch of 200 miles of the mountains is discernible from north to south almost every day of the year. Denver has a climate peculiarly mild and adapted to people suffering with pulmonary complaints; the mean annual temperature is 48° F.; the average annual rainfall is about 14 inches, and the sun shines 275 days in the year.

The city occupies an area of 60 square miles. It is distinctively residential, with broad and shaded streets, and is substantially built of brick and stone. It has over 40 miles of thoroughfares paved with asphalt, while 140 miles are surfaced with disintegrated granite. Of the 30 public parks and 10 children's playgrounds within the city, with a total area of 1239 acres, the largest is City Park, a preserve of 390 acres, adorned with flowers, shrubbery, statuary, etc., and including a zoological garden, an aviary, a natural-history museum, lakes, race track, and driveways. In addition the city has a chain of five mountain parks and a beautiful drive connecting them. Among noteworthy buildings are the capitol on Capitol Hill, erected at a cost of \$2,700,000; the new Federal building, costing \$2,500,000. St. John's Cathedral (Episcopal); the cathedral of the Immaculate Conception (Roman Catholic); Trinity Methodist Episcopal Church; the Auditorium, seating 12,000 persons; the public library, the United States mint, the county courthouse, the First National Bank building, the Denver Gas and Electric building, and the Chamber of Commerce. Every educational advantage possible is available for the children and youth of Denver. There are 64 grade schools, 4 high schools, 1 trade school, 1 manual-training high school, and 1 technical high school. In addition kindergartens, special schools for retarded pupils, open-air schools, and night schools are maintained. The total school census in 1913 was 51,981. Denver is the seat of the University of Denver (Methodist; see **DENVER, UNIVERSITY OF**); the Jesuit College of the Sacred Heart, founded in 1888; Westminster College (Presbyterian); the Cliff School of Theology; Colorado Woman's College; Loretto Heights Academy, and various schools of music and dramatic art. The city has a magnificent public library, with five branch libraries and eight depositories, containing 165,000 volumes, besides the State library of 41,000 volumes, the Supreme Court library with 31,000 volumes, and numerous others.

A combination of favorable natural conditions has resulted in making Denver the leading industrial city of the western mountain region of the United States. Chief of these is its proximity to the great mining region of Colorado, which produces not only metals—lead, copper, iron, gold, silver, tungsten, vanadium, radium, and uranium—but also coal, the latter making

it possible to smelt the ores and thus avoid shipment to other parts for that purpose. The many railroads entering the city make it the best collecting and distributing centre in the Rocky Mountain States, and the great distance from the eastern manufacturing centres exempts it largely from trade competition. The value of the manufactured products of the 738 industrial establishments in 1913 was \$62,950,381, exclusive of the smelting industry, whose products in 1913 amounted to \$7,500,000. Much mining machinery is produced, and the output of the flouring and grist mills is large. The manufacture of malt liquors and railroad-car construction and repairs are considerable industries. Denver is becoming important as a live-stock market. In 1913 the Union Stock Yards handled about 1,385,000 head of stock, valued at \$48,000,000, and the output of the packing plants was estimated at \$12,775,000. The annual Live Stock Show is second only to the one held in Chicago. In addition the city has a large wholesale jobbing trade which is estimated at \$45,000,000 annually. The Denver City Tramway Company operates 235 miles of electric railways, 203 miles of which are within the city limits. The water supply of the city is brought from the mountains. There are 11 reservoirs, of which the Cheesman Dam, located in the mountains 50 miles from Denver, has a capacity of 26,000,000,000 gallons. The commission form of government was adopted by Denver in 1913. All legislative, executive, and administrative powers and duties are vested in a council of five commissioners, who have charge of the departments of property, finance, safety, improvements, and social welfare. They are elected for four years and receive a salary of \$5000 per year. The commissioners elect one of their number as mayor, who presides at the meetings of the council, but has no power of veto. With the exception of the auditor and the election commission, who are elected, the commissioner of each department appoints all officers, commissions, or boards under his control, subject to civil-service regulations. The total annual income of the city is about \$3,800,000. The larger annual appropriations approximate \$1,300,000 for schools, \$300,000 for the fire department, \$300,000 for the police department, \$200,000 for municipal lighting, and \$275,000 for parks.

Denver was first settled by miners in 1858, and in the following year was incorporated as a city by the provisional Legislature and named in honor of Gen. J. W. Denver, then Governor of Kansas. In 1861 it was reincorporated by the first Territorial Legislature. It became the capital of the Territory in 1867 and in 1870, on the completion of the Denver Pacific and Kansas Pacific railroads, was first connected by rail with the East and South. Destructive floods occurred in 1864, in 1876, and in 1912. In 1894 the town of South Denver was annexed. Since 1870 its growth has been exceedingly rapid; a population of 4759 in that year having increased to 35,629 in 1880, 106,713 in 1890, 133,869 in 1900, including 25,300 persons of foreign birth and 3900 of negro descent, and 213,381 in 1910. The population in 1914 was approximately 240,000.

**DENVER, UNIVERSITY OF.** The earliest institution for higher learning in the Rocky Mountain States, founded in 1864 at Denver by Gov. John Evans. It was known as the Colorado

Seminary until 1880, when the school was reorganized and the present name adopted in evidence of its increased educational scope. The departments at University Park are the College of Liberal Arts, the Graduate School, the Summer School, and the Warren Academy. The professional departments, in the heart of Denver, are the Law School, the Dental School, the School of Commerce, and the Teachers' College. The University buildings at University Park are University Hall, the Carnegie Library, the Carnegie Science Hall, the Alumni Gymnasium, the Chapel, the Chamberlain Observatory, one of the most important astronomical stations of the world, and the two dormitories known as Templin Hall and Wycliffe Hall. In Denver the buildings used for school purposes are the Law and Commerce Building and the Dental Building. Five other buildings in Denver and four others at University Park are now producing income. The enrollment for 1913-14 was 1159, of whom 816 (or 70 per cent of the total) reside in Denver. There were, in 1914, 2650 graduates in the regular courses in all departments. All properties and endowments aggregate \$1,200,000 in value. The General Education Board has recognized the University of Denver by a conditional gift of \$100,000. An addition of \$400,000 was made to the productive endowment in 1914. The president in 1914 was Henry A. Buchtel, D.D., LL.D.

**DENZINGER**, dën'tsing-ër, FRANZ JOSEPH (1821-94). A German architect. He was born at Liège, Belgium, where his father was professor at the University. He studied at Würzburg, then in Munich at the Polytechnic Institute and under Gärtner at the Academy of Arts. In 1854 he entered the government service at Regensburg and in 1859 was appointed architect of the cathedral, the restoration and completion of which he carried out in the most successful manner. His next important work was the reconstruction of the cathedral at Frankfort-on-the-Main, which had been destroyed by fire in 1867. Here he also erected the building of the municipal archives and the Dreikönigskirche. Among his other structures may be mentioned the chemical laboratory of the University at Erlangen and the saline bathing establishment at Kissingen. He died in Nuremberg.

**DE'ODAND** (ML. *deodandum*, to be given to God, from *Deo*, to God + *dandum*, to be given). In English law, a term applied to any chattel which was directly instrumental in causing the death of a human being, either by accident or by homicide. Where a person was thus killed a jury was summoned, and, if any domestic animal or inanimate thing was found to be the immediate cause of his death, it was forfeited to the crown, usually for pious or charitable uses—"to appease God's wrath," as some of the early writers put it. Thus, if a horse and cart ran over a person and killed him, they were forfeited as accursed things, irrespective of whether they belonged to the deceased, the person having them in charge, or to some other person who was not otherwise connected with the accident. The right or franchise to have all deodands in a certain district was sometimes granted to individuals by the crown. This curious law, which has its analogies in many primitive legal systems, was not finally abolished in Great Britain until the year 1846 by statute (9 and 10 Vict., c. 62). It was never recognized in the United States. Consult Blackstone, *Commentaries on the Laws of*

England, and Stephen, *History of the Criminal Law of England* (London, 1883).

**DE'ODAR'**. See CEDAR.

**DE'ODORIZER** (from Lat. *de*, from, away + *odor*, smell, scent). Any chemical substance employed for the purpose of absorbing or destroying the odoriferous principles evolved especially from decomposing animal and vegetable matter. They strictly belong to the classes of substances known as antiseptics (q.v.) and disinfectants (q.v.).

**DE OFFICIIS**, *dě* ôf-fish'is (Lat., On Duties). A treatise on morals by Cicero, addressed directly to his son Marcus. The work is in three books, but is doubtless incomplete.

**D'EON DE BEAUMONT**, *dă'ôn'* de bô'môn'. See EON DE BEAUMONT.

**DEOPRAYAG**, *dă'ô-pră-yăg'*, or **DEVAPRAYAGA**, *dă'vâ-pră-yă'gă* (Skt., altar of the gods). A village of the State of Tehri, United Provinces, India, 2265 feet above sea level, remarkable chiefly for its situation at the fork of the Alaknanda and the Bhagirathi, which form the Ganges (Map: India, C 2). As the source of the sacred river, Deoprayag is a favorite place of pilgrimage for the Hindus. The temple of Raghunath, built on a high terrace, is capped by a white cupola, golden ball, and spire. A flight of steps in the rock leads down to the brink of the mingled streams, and there three basins have been excavated in the solid stone a little below the level of the surface of the current for ablutions. The permanent population, about 1000, consists chiefly of Brahmins.

**DE O'RATOR'E** (Lat., On the Orator). A dialogue in three books by Cicero (55 a.c.), treating of the studies necessary for an orator, the matter, and the form and delivery of a speech. The principal speakers are the great orators Lucius Crassus and Marcus Antonius.

**DEPARTMENT** (Fr. *département*, from Lat. *dispartire*, to divide). An administrative division in France. The old provincial divisions were abolished by the Constituent Assembly in 1790, and the country was divided into 83 departments. This was done at the instance of Mirabeau, who pointed out the necessity of wiping out the ancient territorial boundaries in order to concentrate power in the hands of the central government, and to destroy the influence of the aristocracy, which, based upon ancient custom, was still strong in the provinces. In the redistribution, care was taken to efface as far as possible ancient political divisions, and in a large number of instances a department was constituted out of territory taken from two or more provinces. Most of the departments were named after rivers or mountains. At the head of each is a prefect, appointed by the President of the Republic, and assisted by a *conseil de préfecture*. The departments are subdivided into *arrondissements*.

**DEPARTURE**. In nautical language, a distance along a parallel of latitude measured in nautical miles, especially the distance east or west made by a ship. When the course is neither east nor west, the *departure* = *distance sailed*  $\times$  *sine of course*. Since minutes of longitude are in length proportional to the cosine of the latitude in which they are measured, we have *departure* (in nautical miles) = *minutes of longitude*  $\times$  *cosine of the latitude* in which the departure is measured. To determine the exact position of a ship when starting upon a voyage and after leaving port is termed *taking a departure*. It is

usually done by observing the bearings of two or more objects and transferring those bearings to a chart whence the exact point is determined. For use of this term in surveying, see *SURVEYING*.

**DE PAUW (dê-pă') UNIVERSITY**. An institution of higher learning situated at Greencastle, Ind. It was founded by the Indiana Conference of the Methodist Episcopal Church in 1837 and was known until 1884 as the Indiana Asbury University. In recognition of large gifts by the Hon. Washington C. De Pauw during his life and the bequest of a share in his estate which has added more than a half-million dollars to the endowment of the university since his death, the name of the institution was changed to De Pauw University. Schools of Medicine, Law, Theology, Pedagogy, Music, and Art, as well as the College of Liberal Arts, were provided in the charter, and at some time every one of them has been instituted and conducted for a period of years. But for lack of sufficient income to support them on a high educational plane all of the professional schools have been suspended except the School of Music. At the present time the institution includes only the College of Liberal Arts and the School of Music. The plant includes 12 buildings and 50 acres of campus, valued at \$528,000. Recent benefactions and bequests have raised the productive endowment to \$1,200,000. There are 60 instructors in the faculty, and the student enrollment is slightly above 1000. Graduates to the number of 3157 (including all schools) are scattered throughout the world. The president in 1914 was Rev. George R. Grose, D.D.

**DEPENDENT CHILDREN**. A term applied to normal children who must be supported by other than their natural guardians. It does not include the deaf and dumb, blind, insane, epileptic, and feeble-minded, who are classified as *defectives*, nor those of perverse habits, known as *juvenile delinquents*.

In ancient times the Semites placed a higher value on children than did the Aryans. Among the Aryans, however, childless families sometimes adopted children. The father in Greece and Rome had practically power of life and death over his children and could sell them into slavery. Infanticide was common. Yet the children left alone were not entirely neglected, and their adoption was encouraged by decrees making them the slaves of those caring for them. Not until after the introduction of Christianity do we find any special attention paid to child saving. From that time to the present among Europeans and their descendants, and wherever Christian missionaries have gone, we find increasing attention paid to dependent children.

In the sixth century came the beginnings of special institutions for such children in France and a little later in Italy. (See *FOUNDLING HOSPITAL*.) From these humble beginnings the great institutions now found in all civilized lands have grown. The state has come to recognize that it is responsible for the proper care of the children and is gradually extending its efforts for the sake of its own future welfare as well as for that of the children.

From the practice of receiving young children into institutions to save their lives there naturally developed the belief that such institutions were even better places for the children than any family home. Here children would be kept from

the temptations of the world; here they would be cared for by skilled matrons and taught by chosen teachers; here, too, religious instruction would be planted in fruitful soil. The Church, under whose influence these institutions arose, encouraged this belief. This is the principle underlying all institutional care for dependent children. The highest development of this principle is found in the institutions of the Catholic church and of the Hebrews, in which it is possible for a child to pass from infancy to maturity constantly guarded from the world. Europe, except France, has largely followed this method, and it is widespread in America.

The older plan of rearing dependent children in family homes has, however, kept a foothold and is latterly coming rapidly to the front. It exists in two forms. In the first the children are boarded out in families, the board being paid by societies organized for the purpose of caring for children or by the state. This system has been successfully carried on in Scotland and England, but has found its greatest development in Australia and France. In France a special department of the government, with branches in the provinces, boards out the children and supervises them until they are 21 years of age. No board is paid after the twelfth year, the children being then indentured. In the second form the children are placed out for adoption or are indentured to persons willing to receive them and to assume all responsibility for their maintenance and education. After the initial expense of finding and investigating a home, this system costs the public nothing save the expense of supervision to safeguard the interests of the child. This plan has found its chief field in Canada and the United States.

In America during Colonial times children were apprenticed in families or were consigned to the almshouse. It was gradually recognized that the influence of the almshouse was degrading, and the leading States now forbid the practice. It still prevails in the Southern States. Illinois is the only prominent Northern State permitting it. The movement for institutions began about 1800 and rapidly spread in the larger cities. Organized effort for placing children in family homes started with the founding of the New York Children's Aid Society in 1853. Similar societies are now found in most cities. The first of the children's home societies was started in Illinois in 1883. They now exist in 24 States, chiefly in the West. Their work has been largely outside the big cities.

The advocates of the institutional plan and those who favor the placing-out system have long been at swords' points. Each has claimed that the other system did not produce the best results. There is taking place in America, however, a gradual amalgamation of the two systems. It is now admitted that the institution fosters a pride which tends to develop the institution at the expense of the child; that institutional life is artificial and cultivates dependence rather than independence. On the other hand, it is admitted that some children need for a time the training in obedience and in respect for authority which institutional discipline gives; that children in bad physical condition often receive better care in an institution than is possible in the average home; that the work of placing out children must be most carefully done to avoid putting children in bad homes; that it is sometimes hard to find the proper

place for a particular child. To-day institutions are placing out many children, while placing-out agencies are sending children to institutions for temporary care. Both agree that the home is the normal place, and that the place of the institution is to give the necessary training to fit the child for home life. It has so far been possible to find free homes for most of the children placed out, and the boarding-out system has been in use only in the East.

The general interest in the subject has led to the active participation of the State. In New York, California, Pennsylvania, and to a lesser degree in other States, subsidies have been granted from public funds to private societies. The result has not been satisfactory. Large institutions have been built up which tend to receive children not really dependent for the sake of additional revenue. The result is plainly seen by comparing New York with 317.3 dependent children per 100,000 of population; California, 290.8; Pennsylvania, 153.6; Indiana, 110.1; Michigan, 65.6; West Virginia, 18.9; North Dakota, 18; Mississippi, 16.2; Arkansas, 12.7; Oklahoma, 8.8. These differences reflect not merely differences in institutions, but in greater degree differences in economic conditions. Child dependency is largely an urban condition. Michigan in 1874 opened what is known as the State Public School (q.v.). All children becoming public charges are sent to this school and are placed out as soon as seems best. The result has been an actual decrease in the number of dependent children. This system has been adopted in Rhode Island, Wisconsin, Minnesota, and Colorado. In Massachusetts and Pennsylvania the boarding-out system has been largely developed. The State homes for the orphans of soldiers and sailors, started soon after the Civil War, have been generally abandoned or turned into orphan asylums. There is now a strong movement towards State control and supervision of the work for dependent children. New Jersey has organized a State Board of Children's Guardians. Indiana has appointed a State agent. Consult: Wines, *Prisons and Child-Saving Institutions* (Cambridge, Mass., 1880); Hill, *Children of the State* (London, 1889); Folks, *Care of Destitute, Neglected, and Delinquent Children* (Albany, 1900); Henderson, *Introduction to Study of Dependents, Defectives, Delinquents* (Boston, 1893); id., *Modern Methods in Charity* (New York, 1904); *Report of Committee on History of Child-Saving* (Boston, 1893); Bartlett, *Supervision and Education in Charity* (New York, 1903); Devine, *The Principles of Relief* (ib., 1904); *United States Census: Benevolent Institutions* (Washington, 1904); Gray, *Philanthropy and the State* (London, 1908); Conyngton, *How to Help* (New York, 1909); Corrigan, *The Law and the American Child* (Worcester, 1911); Chicago School of Civics and Philanthropy, *The Child in the City* (Chicago, 1911); Engel, *The Elements of Child Protection* (New York, 1912); Webb, *The Prevention of Destitution* (London, 1912).

**DEPENDENTS, DEFECTIVES, DELINQUENTS.** Dependents are those who must be supported by other than their natural guardians or family. Defectives are those who are not normally developed, the blind, etc. Delinquents are those who commit acts forbidden by law. This classification is not satisfactory, but it is in very general use. See SOCIAL DEBTOR CLASSES.

**DE PERE**, də'pĕr'. A city in Brown Co., Wis., 5 miles southwest of Green Bay, on Fox River, and on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads (Map: Wisconsin, F 4). Lake steamers ascend the river as far as De Pere. De Pere is the seat of St. Norbert's College and is the site of the first mission in Wisconsin. The city has good water power and manufactures of bricks, pottery, writing paper, steam boilers, gasoline engines, cigars, sash and doors, skiffs, yachts, launches, flour, woolen goods, foundry products, and dairy products. There are also several limestone quarries. Cattle, grain, and hay are among the exports. A steel bridge over the river 1600 feet long connects the east and west sides of the city. The water works are owned by the municipality. Pop., 1900, 4038; 1910, 4447.

**DEPEW**. A village in Erie Co., N. Y., 8 miles east of Buffalo, on the New York Central and Hudson River, the International Electric, the Delaware, Lackawanna, and Western, the Erie and the Lehigh Valley railroads (Map: New York, B 5). Depew contains a public library and fine high-school building. Its chief manufacturing establishments are locomotive and coupler works, a large smelting plant, and storage battery, spring, and gear factories. The village was incorporated in 1894 and was named after ex-Senator Chauncey M. Depew. Pop., 1890, 3379; 1910, 3921.

**DEPEW, CHAUNCEY MITCHELL** (1834- ). An American lawyer, railroad president, politician, and orator. He was born in Peekskill, N. Y., graduated at Yale in 1856, was admitted to the bar two years later, and soon took an active part in politics. He was in the State Assembly in 1861 and 1862 and Secretary of State of New York from 1863 to 1865. In 1872 he was candidate for lieutenant governor on the Liberal Republican ticket. In 1866 he became attorney for the New York and Harlem Railroad, and in 1869 for the New York Central. He was elected second vice president of the New York Central in 1882 and was president from 1885 to 1898, when he resigned this position and the presidency of the West Shore Railroad to become chairman of the entire Vanderbilt system. He was delegate at large to the Republican national conventions from 1888 to 1904 and nominated Benjamin Harrison in 1888 and Levi P. Morton in 1896. In 1888 he received 99 votes for the presidential nomination. In 1899-1911 he was United States Senator from New York. He had declined the State portfolio in President Harrison's cabinet in 1892. He delivered addresses at the Washington Centennial in New York in 1889 and the dedication of the World's Columbian Exposition at Chicago in 1893, and orations at the memorial services of President Garfield and General Sherman, and was a famous after-dinner speaker. He was a regent of the University of the State of New York in 1877-1904 and a member of the corporation of Yale University in 1893-1906. Senator Depew became involved in the investigation of certain New York life-insurance companies in 1905, with the result that he repaid to the Equitable Life Assurance Society, of which he was a director, a loan made to a concern in which he was interested; and he resigned from the directorate of the Equitable. In 1911 he was succeeded in the Senate by J. A. O'Gorman (Democrat).

**DE PEYSTER**, də'pĕstĕr, ABRAHAM (1658-

1728). An American merchant and Colonial official, son of Johannes de Peyster (q.v.), born in New Amsterdam (New York). He was mayor of New York from 1691 to 1695 and afterward Chief Justice of the province and President of the King's Council; and he acted as Governor in 1701. He served as colonel of the militia of the city and county of New York and as treasurer of the provinces of New York and New Jersey. There is a statue of him in Bowling Green, New York City, by G. E. Bissell.

**DE PEYSTER, ARENT SCHUYLER** (1736-1832). An American soldier, born in New York City, and prominent as a Royalist at the time of the Revolution. From 1775 to 1783 he was in command, at different times, of Detroit, Mackinac, and several posts in Upper Canada, and endeavored to turn the Western Indians against the United States. After the war he removed to Dumfries, Scotland, where he became a friend of Burns.

**DE PEYSTER, JOHANNES** (1600-85). One of the early settlers of New York and the founder of a noted Amsterdam family. In the Colony, then New Amsterdam, he held the offices of burgomaster and deputy mayor and resisted the cession of the province to the British in 1664 and 1674.

**DE PEYSTER, JOHN WATTS** (1821-1907). An American writer on military and historical subjects. He was born in New York City, was educated at Columbia, became colonel in the State militia in 1845, adjutant general in 1855, and brevet major general in 1866. Among his works are: *Life of Field Marshal Torstenson* (1856); *The Dutch at the North Pole, and the Dutch in Maine* (1857); *Personal and Military History of Gen. Philip Kearny* (1869); *Before, at, and after Gettysburg* (1887); *The Real Napoleon Bonaparte* (1897). Consult *Law, Here and There in Two Hemispheres* (Lancaster, Pa., 1903), and F. Allaben, *John Watts de Peyster* (2 vols., New York, 1908).

**DEPHAL**. See BREADFRUIT TREE.

**DEPILATORIES**, or EPILATORIES (Lat. *de-pilare*, to pull out hair, from *de*, off + *pilus*, a hair). Certain agents employed for removing hair from the skin. They were extensively used by the ancients, but are now restricted in their employment to the face and to the removal of the hair from the scalp in the treatment of certain diseases. The agents most commonly used are the caustic alkalis, arsenic, barium sulphide, calcium sulphide, and quicklime. One recipe consists of 5 parts of caustic or slaked lime, 10 parts of carbonate of soda, and 40 parts of lard. The trisulphide of arsenic (commonly known as orpiment) is occasionally used, but its employment is dangerous. A mixture of caustic lime and orpiment constitutes some of the depilatories to be purchased; and it is believed that the Turkish *rusma* is composed of these ingredients. Electrolysis, by means of a strong galvanic current, is used by physicians for the purpose, a needle electrode being applied to the root of each hair.

**D'ÉPINAY**, də'pĕ'nā', MADAME. See EPINAY, MADAME D'.

**DÉPIT AMOUREUX**, də'pĕt' ā'mōō'rĕ', LE (Fr., The Lovers' Quarrel). A comedy by Molière (1654).

**DEPONENT**. A term in Latin grammar applied to verbs having a passive form but an active signification. They are so called because

they, as it were, lay down (Lat. *deponere*) or dispense with the signification proper to their form. Such verbs had originally a reflexive meaning; thus, *aversor*, 'I shun,' means radically "I turn myself away from"; *versor in*, 'I engage in,' means properly "I turn myself about in." They thus correspond to the middle-voice forms of the Greek verb, which, though properly reflexive, became often indistinguishable from the active voice, so that middle forms were used with a direct object. Consult Lindsay, *The Latin Language*, pp. 519 ff. (Oxford, 1894).

**DEPORTATION.** See TRANSPORTATION, PENAL; IMMIGRATION.

**DEPOSIT, or DEPOSITUM** (from ML. *depositare*, from Lat. *deponere*, to lay down). In a legal sense, a term implying possession of personal property by some one not the owner, either by virtue of a delivery thereof, or from some other source as binding, and under such circumstances that he is legally bound to keep it for the benefit of the person who so delivers it, or whoever is, or rightfully becomes, entitled to the possession, and to give up possession at any time, on demand, to such person or persons. It is the most common form of bailment (q.v.), as every case where a person gives another something to hold, or keep for him, for however short a time, comes under this title and is subject to the rules of law governing it. The bailee or depositary, as the person who thus receives the property is called, must take such care of it as a reasonable man would of his own goods; but if he does this, he is not liable for any loss or damage occurring while it is in his hands. The depositary cannot use the property for his own benefit unless there is an express or implied agreement to that effect. Money in a bank to a person's credit, although ordinarily spoken of as a deposit, does not strictly come within the legal use of the term, and is for that reason sometimes designated as an "irregular" deposit. The reason for this is because the bank is only required to return an equivalent amount, and not the particular bills or specie originally delivered to it; and the chief characteristic of a true deposit is that the identical thing is to be kept and returned intact. See BAILMENT; COMMODATUM; DEBT; MANDATE; PLEDGE.

**DEPOSITION** (OF. *deposition*, Fr. *déposition*, from Lat. *deponere*, to lay down). The testimony of a witness, legally taken and committed to writing, by or in the presence of a judge, referee, commissioner, notary public, or other duly qualified official person. It is usually taken by virtue of a commission or letters rogatory issuing out of the court in which the action is pending or which has jurisdiction of the subject matter if taken before trial.

The questions may be asked orally or may be submitted to the witness in the form of written interrogatories. The legal representatives of all parties to the action or proceeding are entitled to be present and to cross-examine the witness or submit cross-interrogatories to be answered. If the competency of the witnesses or the admissibility of the questions or answers is objected to, the objection may in some jurisdictions be stated to the court or officer taking the deposition, and he may either rule on the question at once, noting the objection, ruling, and exception, or reserve it for the opinion of the court from which the commission issued.

The laws of the state having jurisdiction of

the litigation in which the evidence is to be used regulate the manner of taking the testimony, irrespective of the jurisdiction where it is taken. The competency and admissibility of the testimony are determined by the rules of evidence in force where it is offered in court. Depositions are used in all courts, and they may be ordered taken where witnesses are out of the jurisdiction, or, if within the state, if they are very old and infirm or in feeble health, in order to perpetuate their testimony in case of death before the trial. They cannot be used, however, where the witness himself can be produced. See EVIDENCE; TESTIMONY; LETTERS ROGATORY.

**DEPOSITION.** The ecclesiastical penalty by which a clergyman is deprived of churchly authority to exercise the functions of his office. As long as ordination was connected with the right to serve in a particular church, the withdrawal of this right was equivalent to exclusion from all clerical rights; but with the development of the clergy as a privileged order, and when absolute ordinations and changes of place became common, deposition in the stricter sense was confined to the withdrawal of local rights, and the term "degradation" came into use in the twelfth century to signify entire removal of clerical rights. Owing to the belief among Roman Catholics that holy orders are indelebile, the spiritual powers of a deposed priest are held to remain, but he has no right to exercise them, and if he attempts to do so commits an additional grave sin. In case the penalty is remitted upon his proved repentance, he needs, of course, no reordination. Bishops could formerly be deposed by their metropolitan with 12 other bishops as assessors; the right was later reserved to the Pope. The solemn degradation of a priest, after which there could be no reinstatement, included many awe-inspiring ceremonies, such as the removal, piece by piece, of all the sacred vestments designating the successive orders to which he had attained, the scraping of the thumb and finger which had been anointed at ordination, and the shaving of the head to obliterate the tonsure. At present deposition is rarely inflicted. Dismissal and suspension usually take its place. Only the bishop can depose a priest, and he requires for solemn degradation the assistance of at least six dignified clerics learned in the law.

In England a minister may be deposed by a bishop with the assistance of such of his advisers as may conveniently be had. In Scotland the power belongs to the Church courts. In the United States the power to depose is exercised by the various religious bodies. The reasons which may justify such action are scandalous or immoral conduct, preaching or publishing doctrines contrary to the Church standards, or contumacious disrespect for Church authority. See ORDERS, HOLY; DISCIPLINE, ECCLESIASTICAL. Consult Kober, *Die Deposition und Degradation nach den Grundsätzen des Kirchenrechts* (Tübingen, 1867), and Smitte, *Elements of Ecclesiastical Law* (New York, 1889).

**DEPOT**, French pron. *dâ'pô'* (Fr. *dépôt*, OF. *depost*, from Lat. *depositum*, deposit, from *deponere*, to deposit, from *de*, down + *ponere*, to put). A place set apart for the storage of munitions of war or other army stores. All the supply departments of the United States army maintain reserve supplies of articles for which each is responsible. The places at which such

supplies are collected are designated quartermaster, ordnance, engineer, signal corps, or medical supply *depôts*. They are located in different parts of the United States with reference to the facility for supplying troops in peace and in war. In addition to these there are five general recruiting *depôts* located at Fort Slocum, N. Y., Columbus, Ohio, Jefferson, Mo., Fort Logan, Colo., and Fort McDowell, Cal., where recruits are received, trained, and distributed. Similarly for the collection of horses, remount *depôts* have been established at Fort Royal, Va., Fort Reno, Okla., and Fort Keoh, Mont. In England and continental Europe generally the name refers specifically to the headquarters of regiments or divisions, or district headquarters of the territorial recruiting system, according to the country and its army organization. In England, in some instances, it has the same application as in the United States. An army in the field is supplied by *depôts* designated from rear to front, as *base depôts*, *intermediate depôts*, *advance depôts*, *subdepôts*. Consult *Field Service Regulations* (U. S. Army, 1913).

**DEPPING**, GEORGES BERNARD (1784-1853). A French historical writer. He was born at Münster, Westphalia, settled in Paris in 1803, was employed for a time as a teacher in several institutions, and subsequently contributed to French and German periodicals. He wrote on a wide range of subjects. Two of his juvenile works attained wonderful popularity: *Merveilles et beautés de la nature en France* (1811); and *Les soirées d'hiver*, including the instructions of a father to his children on moral and scientific subjects. He assisted Malte-Brun in his geographical works and published a number of histories, books of travel, and biographies, including: *Histoire des expéditions maritimes des Normands* (1826); *Histoire du commerce entre l'Europe et le Levant depuis les croisades* (1832); *Les Juifs au moyen âge* (1834); *Livre des métiers* (1837); *Correspondance administrative sous le règne de Louis XIV* (4 vols., 1850 et seq.).

**DEPRÈS**, de-prá', JOSQUIN (c.1450-1521). A Flemish composer, and one of the greatest masters of that time, born at Condé, Hainaut. He was the successor of Okeghem and the immediate predecessor of Lassus and Palestrina in the evolution of music. Little is known of the details of his life, but there is record of his appointment as chapelmaster of Saint-Quentin and that he studied under Okeghem. From 1471 to 1484 he was at the court of Pope Sixtus IV. The library of the Sistine Chapel to this day treasures much of the fruits of his stay in Rome. During his lifetime he visited or held appointments from the greatest princes and courts of the world. Other composers of Josquin's school had developed the custom of taking a secular cantus firmus, the voice to which it was assigned singing the secular words, the remaining voices singing those of the mass proper. So grave an abuse did this custom become that a reform was brought about in Church music, and all such compositions were condemned. Josquin, however, had consistently striven to realize the emotional content of the words of the mass in his compositions so far as he was able. The invention of music printing by movable types at a time (1498) when Josquin was at the height of his fame as a composer did much to make his music universally popular.

Consult Menil, "Josquin de Près," in *Revue Internationale de Musique*, No. 21 (Paris, 1899).

**DEPRESSION** (Fr. *dépression*, from Lat. *deprimere*, from *de*, down + *primere*, to press), or **DIP OF THE HORIZON**. The angle through which the sea horizon appears depressed in consequence of the elevation of the spectator above the surface of the water.

Let *A* be a point on the surface of the earth, *B* a point situated in a vertical line from *A*. Let *BH* be a tangent to the earth's surface drawn from *B*, *BA* a line in the same vertical plane perpendicular to *AB*. The angle *hBH* is the *true dip* of the horizon to a spectator at *B*.

The true dip measured in minutes is equal to the distance in nautical miles of the visible horizon. Let *C* be the centre of curvature of the surface; then, since *CHB* is a right angle, the angle *hBH* = *HCA*; and the minutes in this angle are the nautical miles in the arc *AC*.

The true dip of the horizon, however, is not exactly the same as its apparent depression. The apparent sea horizon is raised above its true place by atmospheric refraction through an angle which varies according to the state of the atmosphere and the relative temperatures of the air and water, the variation ranging from one-third to one-twenty-third of the amount of the true dip. The rule commonly employed is to diminish the true dip by about one-fourteenth of its amount, to find the apparent dip.

If *S* be a star or the sun in the same vertical plane with *ABH*, and an observation of the altitude above the sea horizon be made by means of a sextant from the point *B* (as from the deck of

a vessel), the apparent dip of the horizon must be subtracted from the observed angle in order to find the altitude of the sun. Owing to the uncertainty of the amount of refraction, the nearest minute to the dip given in the tables is usually taken. The following table gives a notion of the amount of the apparent dip under ordinary conditions, the air and water being supposed to be at the same temperature:

Height, feet	Dip, "	Height, feet	Dip, "
0	0 0	8	2 46
1	0 59	9	2 56
2	1 23	10	3 6
3	1 42	20	4 23
4	1 58	30	5 22
5	2 11	40	6 12
6	2 24	50	6 56
7	2 36	100	9 48

**DEPRETIS**, dà-prá'tés, AGOSTINO (1813-87). An Italian statesman, born at Mezzana, in Stradella, Piedmont. He studied and practiced law in Turin, and, as an adherent of Mazzini,

early took an active part in the national movement towards bringing about the unity of Italy, especially after his election to the Piedmontese Chamber in 1848, where he vigorously supported the Opposition. He established in Turin the Liberal journal *Il Progresso*. Cavour appointed him civil Governor of Brescia in 1859, and Garibaldi named him pro-dictator at Palermo in 1860, where he displayed great zeal in urging the adherence of Sicily to the United Kingdom. He held various portfolios in the cabinet in the years 1862, 1866, 1876, and 1879, and was Prime Minister in 1876-78, 1878-79, and 1881-87. He became the leader of the Opposition after Rattazzi's death in 1873, and from 1876 on grew to be a more and more conspicuous figure in modern Italian history, promoting the adoption of many measures, such as the abolition of oppressive taxes, the creation of free ports, and electoral reform. He died at Stradella, where a monument was erected to his memory in 1893.

**DEPREZ**, de-prâ', MARCEL (1843- ). A French engineer and pioneer electrician. He undertook an expensive series of experiments at Munich in 1872 and in 1882 announced that he had succeeded in transmitting power by telegraph wire for a distance of 35 miles, between Munich and Miesbach, which is said to have been the first successful experiment in the transmission of electric power through a considerable distance. Further experiments were successfully carried out on the line of the Northern Railway of France. He became a member of the Academy, professor of electricity at the Conservatoire des Arts et Métiers, and professor of physics at the Collège de France.

**DE PROFUNDIS** (Lat., Out of the depths). The first words of Psalm cxxx, which forms a portion of the office of the dead in the Roman Catholic church.

**DE PRONVILLE**, ALEX. See TRACY, MARQUIS DE.

**DEPTFORD**, dët'fîerd (formerly *Depeford*, deep ford'). A former town of Kent and Surrey, England, at the mouth of the Ravensbourne, on the right bank of the Thames, 3 miles southeast of London Bridge, now a metropolitan and parliamentary borough of Greater London (Map: London, E 8). The London cattle market here, covering 30 acres, occupies the site of the historic admiralty dockyard, established by Henry VIII, where Queen Elizabeth in 1581 knighted Drake in the ship in which he had encompassed the world and where in 1698 Peter the Great toiled as a shipwright. It was closed in 1869, but the immense victualing yard for the British navy with its extensive establishments remained, and there are also important marine engineering establishments and electric-lighting plants for illuminating the metropolis. Deptford is a favorite residential section for London merchants. Pop., 1901, of parliamentary borough, 110,398; 1911, 109,398.

**DEPUTY** (OF. *député*, Fr. *député*, from ML. *deputare*, appoint, select). One authorized by law to exercise all, or certain, of the functions of an office held by another, as an assistant to the incumbent, and accountable to him. Acts done by a deputy in his official capacity are of the same force and effect as if done by the officer himself. A deputy does not need special authority for each particular act, but proceeds under the general powers vested in him by law, although usually his superior may limit his

duties and supervise his work. An officer is generally responsible for the acts and conduct of his deputies to some extent and therefore is usually given the power of selecting and appointing them.

A deputy is required to take an oath of office; his salary is usually fixed by law; and he is frequently required to give a bond for the honest and faithful performance of his duties. Generally only administrative and executive officers, such as sheriffs, constables, county clerks, etc., are authorized to appoint deputies, as judicial officers, even of very limited jurisdiction, are usually accountable only to the government, and not to other officers of a higher rank. See CON-ONER, MARSHAL; SHERIFF.

**DEPUTY** (in French politics). See POLITICAL PARTIES, France.

**DE PUY**, de pû, WILLIAM HARRISON (1821-1901). An American Methodist Episcopal clergyman, born at Penn Yan, N. Y. He was educated at Genesee College, Union University, and Mount Union College. He was professor of mathematics in Genesee Wesleyan Seminary (Lima, N. Y.) (1851-55); editor of the *Buffalo Christian Advocate* (1855-59); editor of the *Methodist Almanac*, later called the *Methodist Year Book* (1866-89); assistant editor of the *Christian Advocate* of New York (1865-84). He was also editor of the *Daily Christian Advocate* for the general conferences of 1860 and 1872. His publications include: *Three Score Years and Beyond* (1872); *Compendium of Useful Information* (1878); *Home and Health and Home Economy* (1880); *The People's Cyclopædia of Useful Knowledge*, in 2, 3, and later 4 vols. (1882); *The Methodist Centennial Year-Book, 1784-1884* (1884); *The People's Atlas of the World* (1886); *American Revisions and Additions to the Encyclopædia Britannica* (1891); *University of Literature* (1896). Several of his works have had a large circulation.

**DE QUEIROZ**. See EÇA DE QUEIROZ.

**DE QUINCEY**, THOMAS (1785-1859). A great English prose writer. He was born, Aug. 15, 1785, in Manchester, where his father, of the same name, had been a successful merchant in the foreign trade and left at his death an estate producing about £1600 a year; to his son he seems to have bequeathed his love of books. The future essayist as a child was retiring and sensitive; and even before his opium eating had begun, his natural tendency was to live in a dreamworld of his own creation. His somewhat pugilistic elder brother tried without success to develop his character by street fights with town boys. Yet in some directions he made remarkable progress in his studies, especially in Greek, at the grammar schools of Bath and Manchester. "That boy," said one of his teachers, "could harangue an Athenian mob better than you or I could address an English one." At the Manchester school he suffered much from ill health and was unhappy with his fellow students. In 1802 he finally ran away and had a brief adventurous career among the Welsh hills and in London, where he remained a year and nearly starved before he was discovered by his family and sent to Worcester College, Oxford. Here he spent five years, though he left the university without a degree. During this period, in 1804, he resorted for the first time to opium as a cure for severe rheumatic pains in the head; and the habit grew upon him as rapidly and to almost as disastrous an extent as

it did upon Coleridge, gaining a hold upon him which he was never able entirely to shake off, though by 1821 he had succeeded in reducing the quantity sufficiently to allow regular and sustained work. In 1808 he took up his residence on the borders of Grasmere, attracted thither by his affectionate veneration for Wordsworth and Coleridge. Here he enjoyed their society and that of Southey and "Christopher North," read widely in classical, German, and English literature, and began to produce his own magnificent contributions to the latter. Except for his tragic struggle with the opium habit, the events of his later years are not very diversified or striking, and it is difficult to trace them accurately from his own autobiographical remains, which have at times the vagueness and inconsequence of his opium dreams. In 1816 he married and during the rest of his life supported himself and his family almost entirely by his pen, though often embarrassed by the money difficulties which seem inseparable from a certain type of literary genius and which in his case were aggravated by occasional relapses into his besetting sin. From 1819 to 1820 he edited the *Westmoreland Gazette*. After several years (1821-28) spent in London he found it convenient to be nearer *Blackwood's Magazine*, to which he made the first of many contributions in 1826. He therefore settled in Edinburgh, where his family joined him in 1830. After the death of his wife, in 1837, he had his headquarters with his daughters in a cottage at Lasswade, but for his privacy in writing he took lodgings in Edinburgh, often maintaining several workshops of the sort at one time. In one of these lodgings he died, Dec. 8, 1859.

Nearly all his work appeared first in periodicals—*Blackwood's*, *Tait's*, and the *London Magazine*; but its remarkable qualities led to its preservation from the fate of merely ephemeral literature. His first great success was the *Confessions of an English Opium-Eater*, which appeared in the *London Magazine* in 1821 and attracted universal attention. Only a small part of it is devoted to the results of the drug, the rest being a fascinating, if discursive, sketch of the scenes and surroundings of his life up to that time. It was ultimately supplemented by the darker *Suspiria de Profundis* (1845), made up of the marvelous and terrible imaginings inspired by opium. His grim humor is well represented by *Murder Considered as One of the Fine Arts* (1827), and the penetration of his imaginative criticism by his essay *On the Knocking at the Gate in Macbeth* (1823). Special mention may also be made of his *Letters to a Young Man* (1823), of *The Flight of a Tartar Tribe* (1837), and of his essays on *Style and Rhetoric* (1840); on *Joan of Arc* (1847), and *The English Mail Coach* (1849). A series of about 30 articles, collected in 1853 under the title of *Autobiographic Sketches*, is also of great interest. In criticism De Quincey must be regarded very highly; his view of things might be called essentially analytical. His *Literary Reminiscences* embraces broad views of Lamb, Coleridge, Wordsworth, Southey, and others, and there are also studies of Shelley, Keats, Goldsmith, Pope, Godwin, Hazlitt, Landor, etc. It is difficult to find critical matter so luminous and scientific, and the style, at its best incomparable, is as brilliant as the judgments are just.

His great importance to literature lies in the new possibilities which he revealed in English

prose. He has himself in the *Confessions* associated together the names of the seventeenth-century authors who come nearest to being his models in style: "Donne, Chillingworth, Sir Thomas Browne, Jeremy Taylor, Milton, South, Barrow, form a pleiad of seven golden stars such as no literature can match in their own class." But the claim involved in his designation of the *Confessions* and *Suspiria* as "modes of impassioned prose ranging under no precedents that I am aware of in any literature," may be justified by the fact that the gorgeous, colorful, and rhythmical prose in which De Quincey equaled or surpassed his predecessors was in his hands a deliberate and formal style, whose "purple patches" are seldom out of place, and whose majestic and soul-stirring harmonies can be paralleled only among musical instruments by the rich fullness of a great organ. Ruskin is his most conspicuous successor in this style, but it had a wide influence throughout the remainder of the century. His writing is far from faultless, it has two considerable defects—a tendency to lapse, in the midst of a lofty strain, into pointless triviality, and a discursiveness which renders it impossible for him to go straight along the highroad of his main thought without darting off to right and left to explore little green lanes of whimsical fancy or erudite allusion. He will never, perhaps, be a popular writer. He postulates in the reader who is to enjoy him fully too similar an equipment in culture, in imagination, in wide knowledge of books and men; but for that very reason he must remain all the more valued by those who are able to appreciate him—an intellectual luxury and stimulus alike. According to his own famous distinction between the "literature of knowledge" and the "literature of power," it is to the latter class that his own work belongs; and of it may be predicated his general conclusion that such literature will remain "triumphant forever, as long as the language exists in which it speaks."

The first collected edition of his writings appeared in Boston, U. S. A. (1852-55), in 20 vols.; a more complete edition appeared in 1877 in 12 vols. The first English edition appeared in 1853-60 in 12 vols.; a more complete edition in 1862 in 15 vols. For other editions and for criticism, consult: *Collected Writings*, ed. by Masson (14 vols., London, 1889-90); some additional *Uncollected Writings*, ed. by Hogg (ib., 1890); *Posthumous Works*, ed. by Japp (ib., 1891-93); Japp ("H. A. Page"), *Life and Writings of De Quincey* (2 vols., ib., 1877); Masson, *De Quincey* (ib., 1881); Findlay, *Personal Recollections of De Quincey* (ib., 1885); also essays by Saintsbury in *Essays in English Literature, 1780-1860* (1st series, ib., 1890); and Stephen, *Hours in a Library* (ib., 1874-79). There is an excellent study from the scholastic point of view in Minto, *Manual of English Prose Literature* (New York, 1886). Consult also *De Quincey and his Friends*, ed. by Hogg (1895); W. A. Dunn, *Thomas De Quincey's Relation to German Literature and Philosophy* (Strassburg, 1900); H. S. Salt, *De Quincey* (London, 1904); Arvède Barine, *Poètes et névrosés* (2d ed., Paris, 1908).

DE QUINCY. See QUATREMERE.

DE RABUTIN-CHANTAL. See SÉVIGNÉ.

DERA GHAZI KHAN, dēr'a gā-zē' kân. The capital of a district of the same name, Punjab, British India, on the right bank of

the Indus, 45 miles southwest of Multan (Map: India, B 2). Of many large and handsome mosques the chief are those of Ghazi Khan, Chuta Khan, and Abd'ul Jawar. The chief industries of the district are agricultural; wheat and indigo are exported. The town has silk mills, a cotton-ginning factory, flour and oil mills. Pop., 1901, 23,731; 1911, 18,466.

**DERAH**, dĕ-râ'. The Egyptian unit of measure of length. The one most in use is 22.37 English inches, or 57 centimeters. The derah is divided into the *kadam*, one-half; the *abdat*, one-sixth; and the *kerat*, one-twenty-fourth. The derah by which dry goods are sold is 25½ inches, while the derah of Constantinople is 66.34 inches.

**DERA ISMAIL KHAN**, ĕs'mâ-ĕl' kân. The capital of a district of the same name, North-west Frontier Province, British India, 120 miles northwest of Multan (Map: India, B 2). The town, situated 4 miles from the right bank of the Indus, is of modern construction, dating from 1823, when a flood swept away the old town on the river bank. It is surrounded by a thin mud wall with nine gates. An important trade is carried on with Afghanistan, the town being on several of the main caravan routes; and there are two well-equipped bazars where the local manufactures of inlaid woodwork, scarfs, and cotton cloth are traded. Wheat and wool are exported. A military cantonment is stationed here. The old town was founded in the fifteenth century by Ismail Khan, a Baluchi chief whose dynasty lasted through three centuries. Pop., 1901, 31,737; 1911, 35,131.

**DERAIYEH**, or **DERAYEH**, dĕ-rî'yĕ (from Ar. *dair*, camp, house). A ruined city of Arabia in the District of Nejd. It was formerly the capital of the Wahabis and residence of the Sultan of Nejd and was a town of considerable importance (Map: Turkey in Asia, R 11). It was destroyed by the Egyptian forces under Ibrahim Pasha in 1818, and since then it has been little more than a small settlement in the midst of the ruins of the old city, with a population of about 1500.

**DERAJAT**, dĕ-râ-jât' (Ar., camps, pl. of *dair*, camp, house, from *dāra*, to abide). A level plain of the Punjab, British India, in the valley of the Indus. It derives its name from three districts: Dera Ghazi Khan (the most important), Dera Ismail Khan, and Dera Fateh Khan.

**DERBE**, dĕ-rbĕ (Gk. Δέρβη). An ancient city of Asia Minor. Little is known of its history, though from notices in Strabo (535, 567, and 569) it may be inferred that it was a place of some importance. It was the chief city of a district which lay west of the old southern Cappadocian Kingdom of Amyntas and was originally a part of old Lyeconia. In the confusion resulting from the breaking up of the Greek kingdoms of Asia Minor, Derbe, in the first century B.C., became the independent capital of one Antipator, called by Strabo a "pirate," who was conquered by Amyntas about 28 B.C.

Throughout the various changes of local governments incidental to the Roman administration of Asia Minor Derbe continued in possession of the kings of Cappadocia until 41 A.D., when it was incorporated by Claudius into the large Province of Galatia.

Derbe was the last city reached by Paul on his first missionary journey (Acts xiv. 6, 20 f.). Here a Christian church was founded by the

Apostle. On his second and third journeys he again visited the place (Acts xvi. 1; xviii. 23). Since Derbe and its district were governmentally a part of the *Provincia Galatia* in Paul's day, it was probably one of the cities whose Christians were addressed by Paul in the Epistle to the Galatians. See GALATIANS, EPISTLE TO THE.

The district has been carefully examined by Ramsay, after Sterrett, and the site of Derbe fixed as that now occupied by the ruins on and near the mound of Gudelissin, about 45 miles south by east of the modern Konieh (Iconium). Consult: W. M. Ramsay, *The Historical Geography of Asia Minor* (London, 1890); id., *St. Paul the Traveler and Roman Citizen* (New York, 1898); id., *The Cities of St. Paul*, pp. 385-404 (London, 1907), where practically all that is known of the city's history will be found.

**DERBENT**, or **DERBEND**, dĕr-bĕnt' (Pers. *Darband*, bond of the gate; Ar. *Bāb al-Abrāh*, gate of the gates, or *Bāb al-Kadīd*; Turk. *Demirkapu*, gate of iron). A seaport in the Caucasian Province of Daghestan, situated on the Caspian Sea and on the railway line from Baku to Petrowsk (Map: Russia, G 6). Its military and commercial importance was considerable before this century. It is surrounded by strong walls and commanded by a citadel. The surrounding district is abundant in gardens, fruit being the chief article of commerce. Cotton and tobacco are also cultivated. The exploitation of bituminous deposits constitutes the city's chief industry. The harbor is unprotected and shallow. The Caucasian or Derbend Wall, a line of fortifications of the sixth century and formerly strengthened by high towers and formidable gates, begins in the vicinity of the town. Another interesting relic of antiquity in the vicinity is the monument of Kirk-Lar or "forty heroes," dating from the conquest of Daghestan by the Arabs in the seventh century. Derbend was taken by the Mongols in 1220 and, after many changes of masters, by the Russians in 1722. After the Treaty of 1723 the town was returned to Persia, only to be formally annexed to Russia in 1813. Pop., about 15,000, of which 57 per cent are Mohammedans.

**DERBY**, dĕr-bĭ (Dan. *Derwentby*, *Deoruby*, near the Derwent, Lat. *Dervento*). A municipal and parliamentary borough and manufacturing town, the capital of Derbyshire, England, in the wide and fertile valley of the Derwent, thence navigable to the Trent, at the junction of the main branches of the Midland Railway, 129 miles north-northwest of London, and 40 miles north-northeast of Birmingham (Map: England, E 4). The town lies mainly on the west bank of the Derwent. The houses are mostly of brick and the public buildings of stone. The most notable of the latter are All Saints' church, with a beautiful Perpendicular tower, 175 feet high, dating from the sixteenth century, the quaint little fourteenth-century chapel of St. Mary-on-the-Bridge, the Roman Catholic church of St. Mary, built by Pugin, a large market hall and corn exchange. Derby sends two members to Parliament. It owns and operates its electric tramways, water supply, an electric-light plant, public baths and washhouses, cemeteries, markets, and slaughterhouses. The net income from corporate property in 1910 was about \$40,000. It maintains a technical school, a free library, museum, and art gallery. The

free grammar school founded in 1160 is one of the oldest institutions of its kind in England. There is also a large general infirmary. Derby is well situated for manufacture and trade, being connected by canals and railways with a great part of England. The Midland Railway has established large works here, which employ over 12,000 men. Since about 1750 Derby has been famous for its porcelain manufacture. Other manufactures are silk, cotton, lace, hosiery, and elastic fabrics. The first silk mill in England was erected on an island in the Derwent in 1718 by John Lombe. There is a resident United States Consular Agent. Pop., 1901, 114,848; 1911, 123,433. Derby is the birthplace of Herbert Spencer, and Erasmus Darwin wrote many of his works and died here. Opposite Derby was the Roman station *Dervenio*, which stood on the east bank of the river. Roman brass, silver, and gold coins have been found, as well as a Roman pavement, and the foundations of a Roman bridge. Derby was first incorporated in the reign of Henry I. It was the southernmost point reached by Charles Edward, the Young Pretender, in his attempted march to London in 1745.

**DERBY, dĕr'bi.** A city in New Haven Co., Conn., 10 miles west of New Haven, at the confluence of the Naugatuck and Housatonic rivers, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 4). An important industrial centre, its manufactures include pins, typewriting machines, pianos, organs, piano players, heavy castings, engines, dairy and other machinery, files, woolen underwear, corsets, hosiery, combs, hairpins, curling irons, keys, guns, and ammunition. There are many places of interest in the vicinity—Sentinel Hill, Indian Well, Lake Housatonic, and the Housatonic Dam, 25 feet high and  $\frac{1}{4}$  of a mile in length. Derby contains also the Griffin Memorial Hospital and two libraries. The government is administered by a mayor, elected biennially, and a unicameral council. City meetings are held to issue bonds and for action on matters over which power is not vested in the common council. Pop., 1890, 5969; 1900, 7930; 1910, 8991; 1914 (U. S. est.), 9441. The town was settled about 1646 and was known as Paugassett until incorporated as Derby (from Derby, England) in 1675. It was the birthplace of Gen. David Humphreys, prominent in the Revolution. Until 1889 Ansonia was included within its limits. The city of Derby was formed in 1893 by the consolidation of the town of Derby and the borough of Birmingham, founded in 1834. Consult Orcutt and Beardsley, *The History of the Old Town of Derby* (Springfield, 1880), and *The Town Records of Derby 1655-1710* (Derby, 1901).

**DERBY.** A border town in Orleans Co., Vt., 100 miles by rail north by east of Montpelier, on the Boston and Maine Railroad, overlooking Lake Memphremagog (Map: Vermont, E 2). It contains the Derby Academy and a public library. Farming, dairying, and lumbering are carried on, and large quantities of granite, which is extensively quarried here, are shipped. Pop., 1900, 3274; 1910, 3639.

**DERBY, dĕr'bi, or dār'bi, EDWARD GEORGE GEOFFREY SMITH STANLEY, fourteenth EARL OF (1799-1869).** An English statesman. He was born at Knowsley Park, in Lancashire, on March 29, 1799, was educated at Eton and at Christ Church, Oxford, and in 1820, immediately after

leaving the University, he was made a member of Parliament. In 1830 he became Irish Secretary in the Whig ministry of Earl Grey, and by his ability as a debater he rendered very material assistance in the passage of the Reform Bill of 1832. Among his Irish measures were the Education Act, establishing a national board and admitting all children to the schools, but providing for Protestant religious instruction; the Irish Church Temporalities Act, abolishing 10 bishoprics and removing the grievances of first fruits and church rates; and a coercion bill for the trial of Irish rioters by courts-martial. This last measure rendered him unpopular with the advanced Liberals, and he was transferred to the colonial secretaryship in 1833. In that year he distinguished himself by securing the passage of the bill for the abolition of slavery in the West Indies. Becoming alarmed at the intention of the Whigs to appropriate the surplus of the Irish church revenues to purposes of secular education, he left the party in 1834. He soon united with the Tories, and in 1841 he became Colonial Secretary in Peel's ministry. This position he held until 1845, when he resigned because he was opposed to the repeal of the corn laws. He was the recognized head of the Protectionist opposition in the House of Lords, which he had entered as Baron Stanley in 1844, and soon became the leader of the Conservative party. In 1851 he succeeded his father as Earl of Derby. In 1852 the first Derby ministry was formed. But it was of short duration, as were also his second term of office (1858-59) and his third (1866-68), and Disraeli (q.v.) was the leading spirit in all of them. In 1868 he resigned the premiership to Disraeli, and in the following year he died.

Derby was a typical Lancashire magnate of the old school. Traditionally Whig, he left that party because of his repugnance to the rising democracy. While not a statesman of the first rank, he was nevertheless possessed of great ability. His doctrine of free trade with the colonies alone anticipates Conservative doctrine of our own day, and to him, as well as to Disraeli, is due the transformation of the Tories into the modern Conservative party. He was a debater of great ability, excelling especially in invective, and his skill earned him the title of "the Rupert of debate." His passages with O'Connell on the repeal of the Union and the disestablishment of the Irish church are well known. He was a man of high scholarly attainments, who distinguished himself at the university, and was afterward famous for his Latin speeches. He was elected Chancellor of Oxford in 1852 and devoted the leisure of his later years to a metrical translation, or rather paraphrase, of the *Iliad* (published in 1864).

For Derby's speeches, consult Hansard, *Parliamentary Debates* (London, 1803 et seq.). For his life, Keibel, *English Statesmen Since the Peace of 1815: Derby* (London, 1869), and Saintsbury, in Reid, *Prime Ministers of Queen Victoria* (New York, 1892). Consult also Keibel, *History of Toryism* (London, 1866), and Hamilton, in the *Dictionary of National Biography*, vol. liv (ib., 1898).

**DERBY, EDWARD HENRY STANLEY, fifteenth EARL OF (1826-93).** An English statesman, son of the preceding. He studied at Rugby under Arnold and at Trinity College, Cambridge, where he was one of "the Apostles," and from

1848 to 1869 was a member of the House of Commons. In 1852 he was Undersecretary for Foreign Affairs in his father's cabinet, in 1858 Secretary for the Colonies and the first Secretary of State for India, and in 1866-68 and 1874-78 was Secretary for Foreign Affairs. He definitely left the Conservatives in 1880 and joined the Liberal party. From 1882 to 1885 he was Secretary for the Colonies in Mr. Gladstone's second administration and in 1884 negotiated the London Convention with the Boers. In 1886-91 he was a leader of the Liberal Unionist party. From 1891 until his death he was chancellor of the University of London. Consult the sketch by Lecky prefixed to Lord Derby's *Speeches* (London, 1894), by Sanderson and Roscoe.

**DERBY, FREDERICK ARTHUR STANLEY**, sixteenth EARL OF (1841-1908). A British statesman. After serving in the Guards for a short time, he entered the House of Commons as a Conservative. He was Financial Secretary for War (1874-77), and Financial Secretary to the Treasury (1877-78), in the Disraeli cabinet Secretary of State for War (1878-80), and in the first Salisbury cabinet Secretary of State for the Colonies (1885-86), and he served as President of the Board of Trade (1886-88). Created Baron Stanley of Preston in 1886, he was two years later appointed Governor-General of Canada, where he remained until 1893. In the latter year he succeeded his brother Edward Henry Stanley, as Earl of Derby. From 1900 to 1903 he was Financial Secretary to the War Office and from 1903 to 1905 Postmaster-General.

**DERBY, dər'bi, GEORGE HORATIO** (1823-61). An American humorist, commonly known as "John Phœnix," born at Dedham, Mass. He graduated at West Point in 1846 and served in the Mexican War with gallantry. He was on the staff of the commanding general of the Department of the Pacific from 1854 to 1856 and did other engineering service, in the course of which he suffered the sunstroke that caused his death. He has a distinct place among American humorists for *Phœnixiana* (1855) and the *Squibb Papers* (1859), chiefly burlesque sketches of his official experiences, full of whimsicality and important as introducing the rough but amusing humor of the Pacific coast into American literature. Among his best squibs may be mentioned his *Musical Review Extraordinary* and his *New System of English Grammar*.

**DERBY, ORVILLE ADELBERT** (1851-1915). An American geologist, appointed chief of the geographical and geological surveys of São Paulo, Brazil, in 1886. He was born at Kelloggsville, N. Y., and graduated in 1873 at Cornell University, where he was instructor in geology from 1873 to 1875. He visited the Amazon valley in 1870-71 and was connected with Prof. C. F. Hartt's geological commission of Brazil from 1875 to 1878. In 1878 he was appointed curator of the geological department of the National Museum. He published several papers on the geology and geography of Brazil and headed many hydrographical, geographical, and geological surveys. In 1891 he published the first detailed topographical maps of South America based on actual surveys. In 1885 he organized the geographical and geological commission of São Paulo, serving as chief officer until 1904. In 1907 he went as chief officer of another geological survey of Brazil.

**DERBY DAY, dər'bi.** An important day in the calendar of English horse-racing events. The name is derived from the "Derby Stakes" race, run on the second day (Wednesday) of the Epsom Summer Meeting, which takes place about the end of May or, in rare instances, at the beginning of June. The race itself was instituted in 1780 by the Earl of Derby, whence the name. The course is 1 mile, 4 furlongs, and 29 yards in length. Originally the weights carried were 112 pounds for colts and 109 pounds for fillies, but after several changes they are now permanently set at 126 pounds for colts and 121 pounds for fillies. Entries are usually made when the animals are yearlings, two years before the race takes place. The event owes its importance to the fact that the entries in the Derby race represent the highest development of race-horse breeding, besides affording an indication of the probable winners of the subsequent important races. The proximity of the race course (Epsom Downs, Surrey) to London makes possible the tremendous and heterogeneous attendance which is so conspicuous a feature of the race, and which, together with its value as a sporting event, has given the day its present importance. Parliament is adjourned over Derby Day, though of late not without protest on the part of a few of its members, and business generally is suspended as far as London is concerned. In America the term "Derby," preceded by the name of the track or "meeting," has been applied to the day on which the chief race of the year of such meeting is run. See HORSE; HORSE RACING.

**DERBYSHIRE, dər'bi-sheer or dər'bi.** An inland county of England, lying between Yorkshire on the north and Leicestershire on the south (Map: England, E 3). Its area is 1029.5 square miles. It is hilly in the north and level in the south, with a very fertile soil. The Derby Highlands, which reach their maximum altitude in the Peak, 1880 feet, and the Kinder Scout, 2088 feet, form the Peak District, noted for its beautiful scenery, especially along the valleys of the Derwent and the Wye. The largest river is the Trent (which empties into the Humber), and the stream next in importance is one of its tributaries, the Derwent. Matlock and Buxton, among the hills, are fashionable health resorts on account of their warm mineral springs. Throughout the county there are numerous Celtic and Roman remains, mediæval ruins of abbeys, monasteries, and feudal castles, and among the many handsome, noble residences are Haddon Hall and Chatsworth, the seat of the Duke of Devonshire. Derbyshire is more a manufacturing and mining than an agricultural county, though its agricultural industries are important. In the northern portions sheep are raised. In the middle and southern sections good crops of wheat are produced. About seven-tenths of the country is cultivated land. The industries include the manufacture of woollens, cottons, silks, lace, and elastic web. The chief towns are Derby, Buxton, and Belper. Population of ancient or geographic county in 1891, 528,033; 1911, 683,423; of administrative county, 1901, 484,896; 1911, 560,013.

**DERBYSHIRE NECK.** See GOITRE.

**DERBYSHIRE SPAR.** A name given to the splendid crystals of fluorite found in Derbyshire, England.

**DERCUM, FRANCIS XAVIER** (1856- ). An American neurologist, born in Philadelphia. He received the degrees of M.D. and Ph.D. from the University of Pennsylvania in 1877. In 1887 he became neurologist to the Philadelphia Hospital and in 1893 consulting physician to the Asylum for the Chronic Insane at Wernersville, Pa., and after serving the University of Pennsylvania from 1883 to 1892 as instructor in nervous and mental diseases he was appointed professor of the same subjects in the Jefferson Medical College. He was president of the American Neurological Association in 1895-96. Besides editing *Text-Book on Nervous Diseases by American Authors* (1895), he is author of "Rest, Mental Therapeutics and Suggestion," vol. viii of Cohen's *System of Physiologic Therapeutics* (1903), and *A Clinical Manual of Mental Diseases* (1913).

**DERCYLLIDAS** (Lat., from Gk. Δερκυλλίδας, *Derkyllidas*). A distinguished Spartan general and diplomat of the fourth and third centuries B.C. He was sent in 411 B.C. to the Hellespont to arouse the cities to revolt against the supremacy of Athens and in 399, as successor of Thibron, received command of the army stationed in Asia for the defense of the Ionic Greeks against the Persians. At this time Xenophon and the other survivors of the followers of Cyrus the Younger served under him. He took advantage of the hostility existing between Pharnabazus (q.v.) and Tissaphernes (q.v.), concluded a truce with the latter, and successfully invaded Æolis, the satrapy of the former. In 398 he built a wall to guard the Thracian Chersonese against the inroads of the Thracians. He endeavored in 397, by threatening Caria, to obtain the independence of the Ionic Greeks and in 396, when Agesilaus (q.v.) had arrived in Asia, was one of the commissioners for the arrangement of an armistice with Tissaphernes. In 394 he conveyed to Agesilaus and the Greek cities of Asia the tidings of the battle of Corinth. At the time of the battle of Cnidus he was Spartan harmost at Abydos and succeeded in holding that town for the Spartans. He disappears from history after 389 B.C.

**DERELICT** (Lat. *derelictus*, from *de-* + *relinquere*, to abandon). Personal property cast away or abandoned by the owner, especially at sea. The seizure or "occupancy" of derelict property is one of the recognized modes of original, as distinguished from the derivative, acquisition of title. In order to constitute an article derelict, so as to make it available to the first person who chooses to make it his own, it is not sufficient that it should be lost, but it must have been deliberately cast away or abandoned, without expectation or intention of recovering it. Goods thrown away by a thief in his flight, known as *bona vacuata*, are not properly derelict, inasmuch as he has no title to them. The same thing is true of treasure trove. The question of abandonment is one of fact, to be determined from the conduct of the owner at the time of the loss. A vessel or goods found abandoned on the high seas are presumed to be derelict, but not so personal property found without an occupant on land or even in a harbor or river; and the presumption in the former case may be rebutted by showing the circumstances under which the abandonment occurred. See ACQUISITION; ACCRETION; SALVAGE; WRECK. Consult: Blackstone, *Com-*

*mentaries on the Laws of England*; Schouler on *Personal Property* (3d ed., Boston, 1896); MacLachlan, *Treatise on the Law of Merchant Shipping* (4th ed., London, 1892).

**DER-EL-KAMAR**. See DER-EL-KAMAR.  
**DERENBOURG, de-rân'bôor', HARTWIG** (1844-1908). A French Orientalist. He was born in Paris, a son of Joseph Derenbourg, and studied there and at the universities of Göttingen and Leipzig. On his return to Paris in 1867 he was employed in the Bibliothèque Nationale and edited the catalogue of Arabic manuscripts. From 1875 he taught Arabic at the Ecole des Langues Orientales, was made professor there in 1879, and professor of religious science at the Ecole des Hautes Etudes in 1886. His numerous publications include: *De Pluralium Lingue Arabicæ et Æthiopica Formarum Origine et Indole* (1867); *De Diwân de Nâbiqâ Dhabyân* (2 vols., 1869); *Le livre de Sibawaihi, texte arabe* (2 vols., 1881-89), his principal work; *Les manuscrits arabes de l'Escorial* (1884); *Chrestomathie élémentaire de l'arabe littéral* (1885; 2d ed., 1892), *Ousâma Ibn Mounkidh, un émir syrien au premier siècle des croisades* (1886-89); *La science des religions et l'Islamisme* (1888); *Les monuments Sabéens et Mymyarites de la Bibliothèque Nationale* (1891); *Oumara du Yémen, sa vie et son œuvre* (1902).

**DERENBOURG, JOSEPH** (1811-95). A French Orientalist. He was born at Mainz, of Jewish parents, his real name having been Dernburg. He studied at the universities of Giessen and Bonn and, having spent some years at Amsterdam as private tutor, went to Paris in 1838 to complete his study of Oriental languages. In 1852 he was made corrector at the Imprimerie Nationale, in special charge of the Oriental publications. He was elected a member of the Academy of Inscriptions in 1871 and was appointed to the chair of Talmudic science at the Ecole Pratique des Hautes Etudes in 1877. His principal work is the *Essai sur l'histoire et la géographie de la Palestine* (1867). He edited the fables of Lokman (1846), with an introductory essay on their Christian origin, the *Makamat of Hariri, Les séances de Hariri* (1847-53), in collaboration with Reinaud, and an edition of Saadia in collaboration with his son Hartwig (1893). His other works comprise: *L'Histoire de la Palestine d'après le Talmud et les autres écrits rabbiniques* (1867); *Manuel du lecteur* (1871); *Notes épigraphiques* (1877); *Deux versions hébraïques du livre de Kalilah et Dimnah* (1881); *Johannis de Capua: Directorium vite humane* (1889), being a Latin translation of the former work; *Version arabe des proverbes surnommés livre de la recherche de la sagesse de Saadia ben Josef al-Fayyûmî* (1894); *Le livre des parterres fleuris* (1886); *Commentaire de Maimonide sur la Mishnah Seder Tohorot* (1886-91); besides contributions to the *Journal Asiatique* and the *Revue Critique*.

**DE REPUB'LICA** (Lat., On the State). A philosophical treatise on politics by Cicero (c.54-51 B.C.), in six books. It was lost during the Middle Ages, but fragments were found on a palimpsest early in the nineteenth century. About one-third of the work is preserved, including the *Somnium Scipionis*, with which it closed.

**DE RESZKE, EDOUARD and JEAN**. See RESZKE, EDOUARD DE; RESZKE, JEAN DE.

1848 to 1860 was a member of the House of Commons. In 1852 he was Undersecretary for Foreign Affairs in his father's cabinet, in 1858 Secretary for the Colonies and the first Secretary of State for India, and in 1866-68 and 1874-78 was Secretary for Foreign Affairs. He definitely left the Conservatives in 1880 and joined the Liberal party. From 1882 to 1885 he was Secretary for the Colonies in Mr. Gladstone's second administration and in 1884 negotiated the London Convention with the Boers. In 1886-91 he was a leader of the Liberal Unionist party. From 1891 until his death he was chancellor of the University of London. Consult the sketch by Lecky prefixed to Lord Derby's *Speeches* (London, 1894), by Sanderson and Roscoe.

**DER-EL-KAMAR**. See DEIR-EL-KAMAR.  
**DERENBOURG**, de-rén'boor', HARTWIG (1844-1908). A French Orientalist. He was born in Paris, a son of Joseph Derenbourg, and studied there and at the universities of Göttingen and Leipzig. On his return to Paris in 1867 he was employed in the Bibliothèque Nationale and edited the catalogue of Arabic manuscripts. From 1875 he taught Arabic at the Ecole des Langues Orientales, was made professor there in 1879, and professor of religious science at the Ecole des Hautes Etudes in 1886. His numerous publications include: *De Plurimum Lingue Arabicæ et Æthiopice Formarum Origine et Indole* (1867); *De Dicwān de Nābiqā Dhobyānī* (2 vols., 1869); *Le livre de Sibacath, texte arabe* (2 vols., 1881-89), his principal work; *Les manuscrits arabes de l'Escorial* (1884); *Chrestomathis élémentaire de l'arabe littéral* (1885; 2d ed., 1892); *Ousāma Ibn Mounkidh, un émir syrien au premier siècle des croisades* (1886-89); *La science des religions et l'Islamisme* (1886); *Les monuments Sabéens et Mymyarites de la Bibliothèque Nationale* (1891); *Oumara du Yémen, sa vie et son œuvre* (1902).

**DERENBOURG**, JOSEPH (1811-95). A French Orientalist. He was born at Mainz, of Jewish parents, his real name having been Dernburg. He studied at the universities of Giessen and Bonn and, having spent some years at Amsterdam as private tutor, went to Paris in 1838 to complete his study of Oriental languages. In 1852 he was made corrector at the Imprimerie Nationale, in special charge of the Oriental publications. He was elected a member of the Academy of Inscriptions in 1871 and was appointed to the chair of Talmudic science at the Ecole Pratique des Hautes Etudes in 1877. His principal work is the *Essai sur l'histoire et la géographie de la Palestine* (1867). He edited the fables of Lokman (1846), with an introductory essay on their Christian origin, the Makamat of Hariri, *Les séances de Hariri* (1847-53), in collaboration with Reinaud, and an edition of Saadia in collaboration with his son Hartwig (1893). His other works comprise: *L'Histoire de la Palestine d'après le Talmud et les autres écrits rabbiniques* (1867); *Manuel du lecteur* (1871); *Notes épigraphiques* (1877); *Deux versions hébraïques du livre de Kalilah et Dimnah* (1881); *Johannis de Capua: Directorium vite humane* (1889), being a Latin translation of the former work; *Version arabe des proverbes surnommés livre de la recherche de la sagesse de Saadia ben Josef al-Fayyūmī* (1894); *Le livre des parterres fleuris* (1886); *Commentaire de Maimonide sur la Mishnah Seder Tohorot* (1886-91); besides contributions to the *Journal Asiatique* and the *Revue Critique*.

**DE REPUBLICA** (Lat., On the State). A philosophical treatise on politics by Cicero (c.54-51 B.C.), in six books. It was lost during the Middle Ages, but fragments were found on a palimpsest early in the nineteenth century. About one-third of the work is preserved, including the *Somnium Scipionis*, with which it closed.

**DE RESZKE**, EDOUARD and JEAN. See RESZKE, EDOUARD DE; RESZKE, JEAN DE.

**DERFFLINGER**, dër'f'ling-er, GEORG, BARON VON (1606-95). A field marshal of Brandenburg, born at Neuhofen, Austria, of a Protestant family. He entered the Swedish service during the reign of Gustavus Adolphus and advanced to the rank of colonel. In 1642 he was sent by Torstenson to negotiate an alliance with George Rákóczy in Transylvania. In 1654 he entered the service of the Elector of Brandenburg. He fought with distinction in the wars against Poland, Denmark, Sweden, and France, and was promoted to the rank of lieutenant general, in consideration of his splendid assault on Warsaw in 1656, field marshal (1670), and military Governor of Pomerania (1678). The formation and training of the cavalry of the electorate were due chiefly to him, and the celebrated battle of Fehrbellin (June 18, 1675) was decided by his brilliant cavalry charge at the head of 6500 horsemen. The conquest of Stralsund and Rügen (1678), where at the age of 72 he led the attack in person, and the subsequent campaign against Sweden, were among his military feats. The military greatness of Prussia in later times was partly due to the influence exerted upon the army of Brandenburg by men like Derfflinger. Consult Unger, *Feldmarschall Derfflinger* (Berlin, 1896).

**DERG**, dërk, LOUGH (Ir., clear lake). The name of two Irish lakes. 1. The larger is an expansion of the river Shannon, between Tipperary on the southeast and Galway and Clare on the northwest (Map: Ireland, C 4). It is 24 miles long from northeast to southwest and 2 to 6 miles broad. Its surface is about 100 feet above sea level; its average depth, 35 feet. It has several islands. 2. A lake in the south of County Donegal, on the border of Tyrone. It is 3 miles long, 2½ miles broad, and has many islets and rocks. On its wild shores are hills rising 700 to 1200 feet. Saint's Island possesses the remains of a priory founded about the year 600 and was the scene of St. Patrick's vision of purgatory. The place of penance on Station Island was for years the most celebrated spot for pilgrimage in Ireland.

**DE RIGAUD**. See VAUDREUIL, MARQUIS OF.

**DERIVATION**. See ETYMOLOGY.

**DERIVATION** (Lat. *derivatio*, a leading or turning off, from *de*, away, off + *rivus*, small stream, channel, canal). An old term in medicine, descriptive of a method of treating disease, by which it was supposed that the *matrices morbi*, or 'matter of the disease,' was drained away through some channel established for it by artificial means, as by a blister applied over an inflamed lung, or a discharge from the bowels established in a case of dropsy. The term is little used now, though applicable to certain methods of treatment as far as results are concerned.

**D'ERLON**, JEAN BAPTISTE DROUET, COUNT. See ERLON.

**DER'MA**, or **DER'MIS**. See INTEGUMENT.

**DERMATOGEN** (Gk. *derma*, *derma*, skin, bark + *root*, *gen-*, *gen-*, to produce, generate; cf. *gyros*, *genos*, stock, race, origin). A single layer of superficial cells at growing tips, which gives rise to the epidermis. A true dermatogen is found only in the seed plants (spermatophytes) and in the roots of fern plants (pteridophytes). While a distinct dermatogen is evident in many plants, it is by no means such a definitely differentiated generative layer as was once supposed. See MORPHOLOGY.

**DERMATOLOGY** (Gk. *derma*, *derma*, skin + *lógos*, *logos*, discourse, science). The science of the management of the skin and of its diseases. See SKIN.

**DERMATOPHYTES** (Gk. *derma*, *derma*, skin, *phuton*, *phyton*, growth, plant). Cryptogamic vegetable growths, varieties of *Torula*, inhabiting the cuticle or epidermis, and giving rise to some forms of skin diseases, as favus, pityriasis, ringworm (qq.v.), etc.

**DERMESTID BEETLES** (Gk. *derma*, *derma*, skin + *estheîn*, *estheîn*, to eat, literally 'skin-eater'). A family (Dermestidae) of small or moderately sized and very destructive beetles. Both the adults and the larvae feed on a variety of animal and vegetable substances, making them museum and household pests, preserved meats, woollens, furs, feathers, silk, and even drugs being exposed to their depredations. The adults, which are oval or elongated and varicolored, feign death when disturbed, falling to the ground, ventral surface upward, and lying stiff with folded legs. The adults may frequently be found outdoors on flowers and on the windows of infested houses. The larvae, which are short and woolly or fuzzy, do far more damage than the adults. There are 300 to 400 species in the family. The most common of them in the United States are the larder or bacon beetle (see BACON BEETLE), the carpet beetle (qq.v.), the museum pest, and the raspberry worm (qq.v.). One form lives on cobwebs, feeding perhaps on the remains of insects caught there and possibly on the web itself. Species of the genus *Attagenus* are responsible for a curious and beautiful kind of felting, resembling moleskin, of pillows and bedticks, which often puzzles housekeepers. The fumes of carbon bisulphide, applied in a tight inclosure, are fatal both to the beetle and the larvae. Carbon bisulphide, however, is very explosive, and its fumes are harmful to man, and hence it should be used with caution. Benzine and naphtha are helpful in keeping these pests from entering stored goods.

**DERMIS**. See INTEGUMENT.

**DERNA**, dër'ná, or **DERN**. A town of Barca, northern Africa, situated at the mouth of a ravine, 1 mile from the Mediterranean (Map: Africa, Tripoli, G 1). In 1805 it was captured by a force of natives and Americans, led by General Eaton. A fort was begun by the Americans at that time, and stands to-day incomplete. It is the only place on the African continent ever occupied by Americans. Pop. (est.), 7000.

**DERNBURG**, dërn'b'urk, BERNHARD (1865-). A German administrator, born in Darmstadt. His father was an editor of the *Berliner Tageblatt* and his grandfather a privy councillor. He was educated at the Berlin gymnasium and went into the banking business, being employed for several years in the New York house of Ladenburg, Thalmann & Co. In 1901-06 he was a director of the Darmstädter Bank. His "business" administration (1907-10) of the Colonial Office markedly improved the condition of German colonies, especially German East Africa and German Southwest Africa, which he visited in 1907 and 1908. In 1913 he was nominated a member of the Prussian House of Lords. Consult Bongard, *Dernburg in Britisch- und Deutsch-Ostafrika* (Berlin, 1908).

**DERNBURG**, dërn'b'urk, HEINRICH (1829-1907). A German legal scholar, born in Mainz.

He was educated at the universities of Heidelberg and Giessen, was appointed a professor at Zurich in 1852, and at Halle in 1862. In 1873 he became professor of Roman law and Prussian common law at Berlin. He represented the University of Halle in the Prussian Upper House from 1866 and the University of Berlin from 1873. His publications include: *Die Institutionen des Gajus* (1869); a *Lehrbuch des preussischen Privatrechts* (3 vols., 1871-80; 5th ed., 1893 et seq.); *Das preussische Hypothekenrecht* (1877; 2d ed., 1891); *Die Phantasie im Rechte* (1894); *Personliche Rechtsstellung im Burgerlichen Gesetzbuch* (1896); *System des romischen Rechts* (ed. by W. H. Müller, 1911).

**DE ROSNY, de rôné', LÉON.** See ROSNY, LÉON DE.

**DÉROULEDE, dâ'rô'lad', PAUL** (1846-1914). A chauvinistic French poet and political agitator, born in Paris. He wrote: *Chants du soldat* (1872); *Nouveaux chants du soldat* (1875); *Refrains militaires* (1888); *Chants du paysan* (1894); *Poésies militaires* (1896). Déroulède also wrote a patriotic cantata, *Vive la France* (1880); a religious drama, *La Moabite* (1880); and a patriotic play, *L'Hetman* (1877). Other patriotic historical works are *Messire du Guesclin* (1895) and *La mort de Hoche* (1897). Déroulède fought in the War of 1870-71 and subsequently, as the head of the Patriotic League, carried on a passionate agitation for a war of revenge against Germany. He was an ardent supporter of General Boulanger (q.v.). He was a leader of the anti-Dreyfus forces. He was in the Chamber of Deputies from 1893 to 1895 and in 1898-99. In 1900 he was found guilty of plotting against the Republic and sentenced to exile for 10 years, but returned to France in 1905 under a law of amnesty. He stood unsuccessfully as a candidate for election to the Chamber of Deputies in May, 1906.

**DERR, Louis** (1868- ). An American physicist, born at Pottsville, Pa. He graduated at Amherst College in 1889 and studied also at Harvard and at Massachusetts Institute of Technology, where he taught physics after 1892, rising to a full professorship in 1909. From 1893 to 1898 he was also instructor in physics at Boston University and from 1895 to 1908 he supervised the teaching of this subject at the Boston Normal School of Gymnastics. He was elected a fellow of the American Academy of Arts and Sciences. Besides contributing to scientific journals, he edited the *Cyclopedia of Engineering* (1902; 2d ed., 1912) and published *Notes on the Principles of Dynamo and Transformer Design* (1902; 3d ed., 1905), and *Photography for Students of Physics and Chemistry* (1906).

**DERRÉCAGAILX, dêr'râ'kâ'gâ', VICTOR BERNARD** (1833- ). A French soldier, born in Bayonne. He studied at the College of Saint-Cyr, served in the Crimea in 1854 as lieutenant of infantry, and rose to be lieutenant colonel in 1880. In 1883 he was appointed professor at the Ecole de Guerre and in 1888 became chief of the geographical service of the army. He was promoted in 1895 to be a general of division. He is known for his topographical surveys of France and for his works on military affairs, especially *Etude sur les états-majors des armées étrangères* (1869; 2d ed., 1871); *Histoire de la guerre de 1870* (1871); *La guerre moderne* (1885; Eng. trans. by Foster, *Modern War*, 3 vols., 1888-90).

**DER'ICK** (from *Derrick*, a Tyburn hang-

man). A device for hoisting heavy loads and conveying them short distances. In ordinary nomenclature the distinction between derricks and cranes is considerably confused. The most common form of derrick consists of a vertical mast pivoted at its bottom in a fixed bedplate and maintained in an upright position by guy cables or other forms of stays, which radiate from a loose collar or spider encircling a pin in the top of the mast; of a boom hinged to this vertical mast near the bottom so that it may be made to assume various inclinations relative to the mast; and of the tackle and motors necessary to impart motion to the boom and mast and to the load which they carry. The load is suspended from the end of the boom by ropes which pass through a block and thence to the motor at the foot of the mast. The end of the boom is sustained by a cable passing through a block at the top of the mast and thence to the motor at its foot. The mast is revolved on its bottom pivot by means of a horizontal wheel around which a rope passes or by some other simple mechanism. The motions permitted by such a derrick are the vertical hoisting of the load, a swinging motion through the rotation of the shaft on its pivot, and a radial motion due to the change in inclination of the boom. Perhaps the most salient distinction between a derrick and a crane is that the boom of the derrick is hinged at its connection with the mast, while the jib of a crane is always rigidly connected with the upright member. If this distinction is maintained in classifying these two sorts of hoisting and conveying devices, however, it throws many devices now called derricks into the class of cranes. Derricks of the type described are extensively employed in quarrying, masonry work, excavating, and building erection, and instead of wooden booms and masts, built-up lattice booms and masts of steel are employed. Such derricks may have a capacity up to 100 tons or more. For "floating derricks," see CRANE.

A hauling derrick, as distinguished from a hoisting derrick, is a drum and the necessary driving gearing from two cranks, mounted in a suitable frame. The rope from the drum leads horizontally to the object to be moved. The hauling derrick is like a geared capstan whose barrel is horizontal instead of vertical, as in the original form.

**DERRINGER, dêr'rîn-jêr.** A short-barreled pistol of very large calibre and very effective at short range. It was usually carried in the side pocket of the coat, and in emergencies fired without being withdrawn. It derives its name from its inventor, an American gunsmith.

**DERRY.** See LONDONDERRY.

**DERRY.** A town in Rockingham Co., N. H., 12 miles southeast of Manchester, on the Boston and Maine Railroad (Map: New Hampshire, G 8). It contains the Pinkerton Academy, a public library, and the homestead of Matthew Thornton, a signer of the Declaration of Independence. The chief industries are shoe manufacturing, milk shipping, and apple raising. There are also manufactories of plant stakes, tree labels, reed ribs, carriages, acetylene-gas machines, and witch hazel. The water works are owned by the town. Pop., 1900, 3583; 1910, 5123.

**DERRY.** A borough in Westmoreland Co., Pa., 45 miles east by south of Pittsburgh, on the Pennsylvania Railroad (Map: Pennsylvania, C 7). It is a summer resort and has bottling and

sand works and manufactories of china and high-voltage insulators. Pop., 1900, 2347; 1910, 2954.

**DERVENTIO**, dër-ven'shò. The Latin name of the town of Derby (q.v.), in England.

**DERVISH** (Ar. *darwish*, Pers. *darvish*, poor, Avesta *driyu*, poor; the Persian equivalent of Ar. *fakir*, poor ascetic). In Mohammedan countries, a class of persons who are supposed to lead a peculiarly religious life, resembling in some respects the monks of Christendom. There are many different brotherhoods or orders. D'Ohsen, in his work on the Ottoman Empire, enumerates 32 and Hammer-Purgstall 36, but the list is far from being complete. The first founders of such orders are supposed to have been Abd al Kadir of Jilan (died 1166) and Ahmad al Rifai (died 1182); and the establishment of orders has gone on until the present time. They live mostly in convents, well endowed, both in land and money, called Tekkije, and are under a chief with the title of Sheikh, i.e., 'elder.' Some of the monks are married and allowed to live out of the monastery, but most sleep there some nights each week. Their devotional exercises consist in meetings for worship, frequent prayers, religious dances, and mortifications. The main devotional exercise, however, is the *zikr*, which is conducted differently in the different orders. It consists in the repetition of certain formulas, accompanied by violent motions until the dervish falls into a cataleptic state. As the convent does not provide them with clothing, they are obliged to work more or less. Three of the orders—the Bastamiyah, the Nakshabandiyah, and the Baktaschiyah—claim to be descended from the original order established by the first Caliph, Abu-Bekr. Of these, the Nakshabandiyah are the most numerous. In their convents at Cairo and Constantinople and elsewhere they have services on Wednesdays and Sundays, when about 20 performers take part in the *zikr* ceremony. The orders are spread throughout the Mohammedan world and in India. The most popular one is that of the Muradiyah, to which most of the fakirs belong who crowd the bazars of India. The Rufaiyah (founded 1182) in India, Turkey, and Egypt, are known for their severe discipline and the castigations of their bodies. They are commonly known as the "Howling Dervishes." Another popular order is that of the Kalandariyah, known also as the "Wandering Dervishes," among whom constant traveling is an obligation. The Maulawiyah constitute the order familiarly known as the "Dancing Dervishes." At their *zikr* they follow one another about the floor in regular order, each with eyes closed and arms extended, turning around in a sort of waltz and intoning a monotonous chant. Each order has its own rules and principles, extending to the dress and the method of wearing the hair and beard. In many of the orders the initiation rites are most elaborate.

Tradition refers the origin of these orders to the earliest times of Islam, making the caliphs Abu-Bekr and Ali found such brotherhoods. While it is certain that Mohammed advocated poverty, the tendencies of thought that led to the founding of dervish orders developed later, when Mohammedanism came into contact with other religions, such as Persian and Hindu. Many Mohammedan princes have held dervishes in high respect and bestowed rich endowments on their establishments, and they are still held in high veneration by the people. For a time,

however, they were regarded with suspicion by the government, since they decline to obey any authority except the religious head of the order. Hence Mahmud II in 1826 attempted to destroy the orders, actually putting to death some of the leaders. His attempt, however, failed. The relation of the dervish orders to the growth of mysticism in Islam and the religious vitality shown in these have been well brought out by Macdonald.

Besides those dervishes regularly affiliated with an order, there are individuals who travel from place to place and by feats of strength or sleight of hand manage to earn a livelihood. Consult: D'Ohsen, *Tableau général de l'empire Ottoman* (Paris, 1878-90); Hammer-Purgstall, in *Geschichte des osmanischen Reiches* (Pesth, 1827-35); Lane, *The Modern Egyptians* (London, 1836); Malcolm, *History of Persia* (ib., 1829); Browne, *The Dervishes* (ib., 1868); Rinn, *Marabouts et Kholvan* (Algiers, 1884); Chatelier, *Les confréries musulmanes du Hedjaz* (Paris, 1887); Depont et Coppolani, *Les confréries religieuses musulmanes* (Algiers, 1897); Zwemer, *Arabia, the Cradle of Islam* (1900); Jacob, *Die Bektaschijje* (Munich, 1909); Macdonald, *Aspects of Islam* (New York, 1911).

**DERVISH PASHA**, dër-vèsh' pà-shà', IBRAHIM (1817-96). A Turkish soldier and statesman, born in Constantinople. He studied mineralogy in London and Paris and taught chemistry and physics in the Constantinople military school. He attained the rank of general of division in 1862 and successfully commanded the Turkish forces in the campaign against Montenegro. He was Ambassador to St. Petersburg and then was placed in charge of the civil and military administration of Albania and Syria. He became Governor-General of Bosnia and Herzegovina in 1875 but, failing to quell the insurrection of that year, was recalled. In 1876 he was Minister of War. In the Russo-Turkish War of 1877-78 he distinguished himself by his successful defense of Batum. As Governor-General of Albania in 1880-81 he reestablished Ottoman authority and brought as prisoners to Constantinople the leaders of the revolutionary league, whom he defeated at Duleigno.

**DERWENT**, dër-wènt (clear water). One of the principal rivers of Tasmania. It issues from Lake St. Clair, in the centre of the island, flows tortuously towards the southeast, passes by Hobart, the capital, and after a course of 130 miles enters Storm Bay, in D'Entrecasteaux Channel, by an estuary 4 miles wide (Map: Tasmania, C 3). The Derwent is navigable as far as Hobart for ships of any burden.

**DERWENTWATER**, dër-wènt-wa'tër. An oval sheet of water in the south of Cumberland, England, one of the most beautiful lakes of that county (Map: England, C 2). It is 3 miles long, 1 mile broad, 72 feet deep, and 222 feet above sea level. Its banks are rocky and abrupt, and behind them rise rocky mountains, one of which, the Cat Bells, is 1448 feet high; another, Lodore, has a waterfall of 100 feet. Derwentwater is an enlargement of the Derwent River, which flows into the Irish Sea at Workington. It has several wooded isles, besides a remarkable floating isle—a mass of earthy matter, 6 feet thick, varying in size in different years from an acre to a few square rods, covered with vegetation and full of gas bubbles which buoy it on the surface of the water. The lake abounds in trout, pike, perch, and eels.

**DERWENTWATER**, der-went-wa'tér, JAMES RADCLIFFE or RADCLIFFE, third and last EARL OF (1689-1716). An English Roman Catholic nobleman, one of the leaders in the Rebellion of 1715. He came of an ancient Northumberland family and was born in London, June 28, 1689. He received his education in France and at his father's death in 1705 became Earl of Derwentwater. He joined the Pretender in 1715 with 70 retainers and after fighting with great heroism was taken prisoner at Preston. He was convicted of treason and despite all efforts to save him was beheaded on Tower Hill, Feb. 24, 1716, his rank, youth, amiability, bravery, and simplicity of motives exciting widespread sympathy. His estates were forfeited and given to Greenwich Hospital.

**DERZHAVIN**, dyér-zhà'vén, GAVRIIL ROMANOVITCH (1743-1816). A celebrated Russian lyric poet. Born of a noble family at Kazan, he entered there the newly opened gymnasium in 1759, joined the ranks of the Preobrazhensky Guard Regiment in 1782, became lieutenant captain in 1773, and later entered the civil service. His ode, *Felitsa* (1782), in which he extolled Catharine II, attracted her attention, and through her influence he received many promotions; he was Governor of Olonetz in 1784, of Tambov in 1785, Secretary of State in 1791, and Senator in 1793. Catharine's successor, Paul, appointed him President of the Board of Commerce in 1796, and Alexander I made him Minister of Justice in 1802; but he retired to private life in 1803. His earlier work, in general, was done in imitation of Lomonosov (q.v.). But he soon abandoned this style, for which his gifts were utterly unsuited, and adopted the manner of the odes of Horace. He was the greatest and most original poet before Pushkin and is best known as the "Singer of Catharine," his works forming a poetic chronicle of her achievements. So far from being a court poet, he was a really deep and sincere admirer of the northern Semiramis, with her liberal reforms and democratic leanings, as evidenced in her daily life and correspondence with Voltaire and Diderot. Though occupying a more exalted position after Catharine's death, he never wrote anything about the other monarchs that in power and loftiness of conception could even approach his odes about Catharine and the events of her reign. His language is quite modern in its purity and comparative freedom from Church-Slavonic expressions. Its chief characteristics are vigor united with pliancy, and a vivid imagery that sometimes verges on the hyperbolic. He was the first to introduce everyday expressions into odes, thus bringing down the grand style to modern realism. One of his greatest contributions to the development of Russian poetry consisted in introducing an element of realism and a touch of humor—even of whimsicality—into the labored and remote verse of Lomonosov. His own poetry reflects a clear, satirical mind, good judgment, and sound sentiment. Of his many poems, the ode *God* is the best known, having been translated into most Occidental languages and even into Japanese and Chinese. The best edition of his works appeared in 9 vols. (St. Petersburg, 1864-83), with a commentary and biography by the academician J. Grot. The eighth volume is devoted to the poet's biography.

**DÉS**, or **DÉES**, dás. The capital of the

Province of Szolnok-Doboka, Transylvania, Hungary, near the confluence of the Great and Little Sáros, 37½ miles northeast of Klausenburg by rail (Map: Austria-Hungary, H 3). Its chief public buildings are the fifteenth-century Gothic Reformed Church, the Thokoly Palace, Franciscan abbey, the handsome town hall and municipal theatre. A sixteenth-century tower is a remnant of the ancient fortifications. Weaving, distilling, and salt mines are among the principal industries. Pop., 1900, 9888; 1910, 11,542.

**DESAGUADERO**, dà-sà'gwa-dá'ró (Sp., outlet). A river of Bolivia, the outlet of Lake Titicaca. After a southeast course of 190 miles it empties into the landlocked lake of Aullagas, near the town of Oruro (Map: Bolivia, D 7). It is the loftiest stream of any length on the entire American continent, its source being 12,650 feet high.

**DESAIX DE VEYGOUX**, de-sà' or de-zà' de vá'gō', LOUIS CHARLES ANTOINE (1768-1800). A French general of the First Republic, born Aug. 17, 1768, at Saint-Hilaire d'AYat. He studied at the military school of Effiat and in 1783 was made sublieutenant in a Breton regiment. He was in sympathy with the revolutionists, though he deprecated their violence, and in 1792 he was appointed aid to Prince Victor de Broglie, then commanding the Army of the Rhine. In 1793-94 he was made a general of brigade and then of division. He commanded the right wing of the Army of the Sambre and Meuse under Jourdan in 1795, and in the following year was again in the Army of the Rhine and Moselle, under Moreau, commanding the left wing in Moreau's famous retreat through the Black Forest. To Desaix was intrusted the fortress of Kehl, the only stronghold upon the right bank of the Rhine which the French retained after this retreat. The fort was in ruins, but behind its imperfect defenses Desaix held out against an Austrian army for two months, only surrendering in January, 1797, when his ammunition was exhausted. In the spring he was sent to Italy, where Bonaparte, recognizing his strong qualities, took pains to attach him to himself. Desaix accompanied the Egyptian expedition and there won his brightest laurels in the conquest of Upper Egypt from the Mamelukes under Murad Bey, after an eight months' campaign. By his equitable administration of the country after the conquest he won from the Arabs the title of "the Just Sultan." Returning to France at the command of Bonaparte in 1799, he joined the latter in Italy and was given the command of two divisions of reserves. This force, in June, 1800, was sent to Genoa on detached service, but in response to the sound of the distant fighting at Marengo (June 14), Desaix, by a sudden inspiration, returned, arriving just as Bonaparte was about to yield the field to Melas. Desaix saved the day by a vigorous attack with his divisions, but he was shot and instantly killed while leading the charge. He was an intrepid soldier, a skillful commander, and the idol of his troops. His body was embalmed and placed in the monastery of St. Bernard. A statue has been raised in his honor in Paris. Consult: Martha-Becker, *Études historiques sur le général Desaix* (Clermont, 1852); E. Bonval, *Histoire de Desaix* (Paris, 1881); C. Desprez, *Desaix* (ib., 1884).

**DE SALABERRY**, CHARLES MICHEL D'IRUM-

**BERRY** (1778-1829). A Canadian soldier. He was born at Beauport, P. Q., and early entering the army was at the conquest of Martinique (1795), accompanied Major General Rottenburg as aid-de-camp in the Walcheren expedition, and was for 11 years in the West Indies under General Prescott. On returning to Lower Canada he organized and commanded the regiment of Voltigeurs, and was a chief of staff in the militia. During the War of 1812 he rendered valuable service. His first success was won near the close of 1812, at Lacolle, against the American General Dearborn; and in 1813, by his superior knowledge of the country through which General Hampton advanced to attack him and also in part by his skillful manœuvring of his troops so as to create the impression of a large force, he defeated that general at Chateauguay, a village about 24 miles southwest of Montreal. This success permitted Gen. Baron de Rottenburg, and afterward his successor, Gen. Sir Gordon Drummond, to resume active operations in Upper Canada. After the close of the war De Salaberry entered political life and in 1818 was appointed a member of the Legislative Council of Lower Canada. He died at Chambly.

**DE SANCTIS**, dâ sânk'tés, **FRANCESCO** (1817-83). A great Italian critic and teacher, born at Morra, Irpino. Imprisoned for revolutionary activities in 1849, he later went to Malta and Turin (1852); his brilliant lectures on Dante won him in 1856 a professorship at Zurich. Returning to Naples in 1860 as Minister of Public Instruction, he became deputy in 1861, and headed the Education Department of the kingdom in 1861-62, 1878, and 1879-80. He became professor at Naples in 1871. He founded the journal *L'Italia* in 1862. De Sanctis was a great force in the intellectual life of Italy, particularly in the south, where he took up the tradition left by Vico and passed it on re-enforced to the greatest of his successors, Benedetto Croce. His criticism is an advance on the historical methods of Sainte-Beuve and on the systematic intellectualism of the Hegelians: rigorously scientific in procedure, it takes as its point of departure the immediate impression produced by the work of art itself, from that working back to the reconstruction of the consciousness of the author in all its varied aspects. The interpretations of great Italian writers in the *Storia della letteratura italiana*, in *Saggi critici*, and *Nuovi Saggi critici* are all classics, and in some cases seem to be definitive. Consult B. Croce, *Estetica* (Bari, 1908), chap. xv. The works are now appearing at Bari (1913- ).

**DE SANCTIS**, **LUIGI** (1808-69). An Italian theologian. A distinguished prelate in Rome, he was converted by the study of the Bible and in 1847 fled to Malta, where he became a Protestant. From 1852 he worked as a preacher of the Waldensian congregation in Turin; became, in 1854, the head of the "Chiesa Libera," a radical offshoot of the Waldensians, which body he, however, joined again in 1864, accepting a professorship at their seminary in Florence, where he also established the Protestant periodical *Eco della Verità*. Consult Rönneke, *Luigi De Sanctis* (Halle, 1890).

**DESARGUES**, de-zârg', **GÉRARD** (1593-1662). A French mathematician, especially gifted as a geometer. He was born in Lyons and is chiefly known as one of the founders of modern

geometry. Poncelet called him "the Monge of his century." Desargues and Pascal introduced the method of perspective and treated the conic sections (q.v.) as projections of a circle. Two important theorems are attributed to Desargues, one of which forms the basis of his remarkable theory of homological figures. To Desargues is further due much of the theories of involution and transversals, the elaboration of the conception that a straight line is a curve closed at infinity, and the definition of parallels as lines intersecting at infinity. The works of Desargues were long thought to be lost, but they were found and republished by Poudra in 1864. The chief ones are as follows: *Méthode universelle de mettre en perspective les objets donnés réellement ou en devis, avec leurs proportions, mesures, éloignement, sans employer aucun point qui soit hors du champ de l'ouvrage* (1636); *Brouillon project d'une atteinte aux événements des recontres d'un cône avec un plan* (1639); *Brouillon project . . . pour la coupe des pierres* (1640); *Gnomonique* (1640). For his biography, consult Poudra, in Desargues's *Euvres* (Paris, 1864).

**DESART**, dèz'art, **WILLIAM ULICK O'CONNOR CUFFE**, fourth EARL OF (1845-98). An English novelist. He was born in London and was educated at Eton and at Bonn. After serving as page of honor to Queen Victoria, he became lieutenant in the Grenadier Guards (1862) and then captain (1865). Much of his later life was passed in Canada. He died Sept. 15, 1898. He was the author of many novels, among which are: *Only a Woman's Love* (1868); *Children of Nature*, a story of modern London, which caused a sensation (1877); *Kelverdale* (1878); *The Honorable Ella* (1879); *Mervyne O'Connor and Other Tales* (1880); *Lord and Lady Piccadilly* (1887); *Love and Pride on an Iceberg, and Other Tales* (1887); *The Road of the Detrimental* (1897).

**DÉS AUGIERS**, dâ'zô'zh'yâ', **MARC ANTOINE MADELEINE** (1772-1827). A French writer of songs and vaudevilles. He was born at Fréjus and was a son of the composer Marc Antoine Désaugiers (1742-93). He was educated for the ministry at the Collège Mazarin, Paris, but discontinued his studies in order to visit Santo Domingo. His attitude here during the negro insurrection imperiled his life, and he was compelled to seek refuge on an American steamer bound for Philadelphia. In that city he devoted himself for several years to piano-forte instruction. Upon his return to France he acquired a considerable reputation as a writer of songs and vaudevilles and subsequently became director of the Vaudeville Theatre of Paris, a position which he held till his death. Several of his songs are still popular. Among them are *La treille de la sincérité* and *Paris ô cinq heures du matin*. The complete works of this amiable and charming writer, who is held by some to surpass even Béranger, were published in Paris in 1827 under the title *Chansons et poésies diverses*. One of his most humorous productions is the one-act vaudeville entitled *Milord Go, ou le di-huit Brumaire* (1804).

**DESAULT**, de-zô', **PIERRE JOSEPH** (1744-95). A French anatomist and surgeon. He became professor of anatomy in Paris in 1776 at the age of 32, was admitted to membership in the corporation of surgeons in the same year, and subsequently held various positions of honor.

In 1782 he was appointed surgeon major to the De la Charité Hospital and came to be regarded as one of the ablest surgeons of his time. He next went to the Hôtel Dieu, and after Moreau's death the surgical department of the hospital was intrusted to him. There he instituted a clinical school of surgery—the first of its type—attracting pupils from all over Europe. He introduced system and precision into surgery and made many valuable improvements in the instruments used in that profession. He established the *Journal de chirurgie* in 1791. His pupil, the celebrated Bichat (q.v.), published his *Œuvres chirurgicales* (3 vols., 1798-1803; 3d ed., 1813; Eng. trans., 1814). Consult Labruce, *Étude sur la vie et les travaux de Desault* (Besançon, 1867).

**DESBARRES**, dā'bār', or **DES BARRÉS**, JOSEPH FREDERICK WALSH (1722-1824). An English military engineer and hydrographer. He graduated at the Royal Military Academy of Woolwich and was sent to America, where he was engaged in the French and Indian War as lieutenant of artillery. He was in the expedition against Louisburg and in the siege of Quebec was aid to Wolfe, who fell into his arms when he received his death wound. From 1763 to 1773 Desbarres was charged with important engineering surveys in Nova Scotia, Newfoundland, and other British colonies, with a view of establishing a chain of military posts. He was also engaged in correcting old and making new charts of the North American coast, which were published in 2 vols. in 1777, under the title of the *Atlantic Neptune*. In 1784 he became Governor of the island of Cape Breton and soon afterward began to build the town of Sydney, where he opened the coal trade. In 1805, at the age of 83, he was made Lieutenant Governor and commander in chief of Prince Edward Island and served until 1813.

**DESBORDS-VALMORE**, dā'bōrd' vāl'mōr', MARCELINE FÉLICITÉ JOSEPHÉ (1785-1859). A French poet, born at Douai. She began public life as a singer in comic opera (1801), but soon left the stage, and from 1819 till 1843 published sentimental verses of much sweetness and pathos, collected under the suggestive titles: *Élégies et romances* (1818); *Élégies et poésies nouvelles* (1824); *Les pleurs* (1833), *Pauvres fleurs!* (1839); *Bouquets et prières* (1843); *Poésies de l'enfance*. Her popular song "S'il avait su" is in most anthologies. For an elaborate study of her poems, consult Sainte-Beuve, *Nouveaux lundis*, vol. xii (Paris, 1869), and Potez, *L'Œuvre littéraire du Nord dans les temps modernes* (Mme. Desbordes-Valmore, Soudan, A. Samain) (Lille, 1909).

**DESBOROUGH**, dēz'bōr-ō, JOHN (1608-80). An English soldier, born at Eltisley, Cambridgeshire. During the Civil War he served as captain of horse and as major under his brother-in-law, Oliver Cromwell, and later, becoming colonel, was in command of the forces at Great Yarmouth. His relationship to the Lord Protector led to his preferment to many positions of honor, including a seat in the Council of State, the commissionership of the Treasury, and later also the commissionership of the Admiralty and Navy. He was a member of the parliaments of 1654 and 1656, of the Privy Council in 1657, and in the following year of Cromwell's House of Lords. After Oliver Cromwell's death he joined a conspiracy of officers against the Protector's nephew,

Richard. Restoration following, Desborough was twice imprisoned, fled to Holland, was imprisoned a third time upon his return to England, but was soon released. He was a subject of Butler's ridicule in *Hudibras*.

**DESCAMPS**, dā'kām', **BARON** EDOUARD (1847- ). A Belgian jurist, born in Belleil and educated at Namur and Louvain. In 1872 he became professor of international law at Louvain, in 1892 he was chosen a member of the Belgian Senate, and in 1907 he became Minister of Science and Art. He was a member of The Hague (permanent) Arbitration Tribunal and was counsel for the United States in the California Pious Fund case and for Japan in the House-Tax case. Among his published works are: *Les offices internationaux* (1894); *L'Organisation de l'arbitrage internationale* (1896); *Le droit de la paix et de la guerre* (1898); *La neutralité de la Belgique* (1902); *L'Afrique nouvelle* (1903); *L'Avenir d'Albanie* (1913).

**DESCAMPS**, dā'kām', **JEAN BAPTISTE** (1706-91). A French author and painter, born at Dunkirk. He studied painting under Ulin and Largillière and in 1740 founded an academy of painting, sculpture, and architecture in Rouen, where he was professor for many years. There are pictures by him in the Louvre, the Dunkirk Museum, and the Rouen Museum. His subjects were usually peasant scenes, but he also painted a series of episodes from the life of Louis XV. Descamps is best remembered for his *Vies des peintres flamands, allemands, et hollandais* (4 vols., 1753-63), a work formerly much esteemed, but not very critical, and his *Voyage pittoresque de la Flandre et du Brabant* (1759).

**DESCANT**, dēs'kānt, or **DISCANT** (OF, *descant*, ML. *discantus*, from *dis*-, asunder, apart + *cantus*, song, singing). A term which in mediaeval times was applied to contrary motion in polyphony, as distinguished from the parallel motion of the parts of the so-called *organum*. In modern part music, the highest part, the treble or soprano voice.

**DESCARTES**, dā'kār't', **RENÉ**; Lat. **RENATUS** CARTESIUS (1596-1650). One of the most distinguished modern philosophers, sometimes called "the father of modern philosophy." He was born at La Haye, in Touraine, and was sent at the age of eight years to the Jesuit school at La Flèche, where he soon became distinguished for his keenness of intellect and made great and rapid progress in languages, mathematics, and astronomy. It was not long, however, before he became dissatisfied with the doctrines and method of scholasticism and felt it impossible to acquiesce in what had hitherto been regarded as knowledge. The first thing that he did after leaving school in 1612 was to abandon books and endeavor to efface from his mind all that he had hitherto been taught, that it might be free to receive the impressions of truth whencesoever they should come. In pursuance of his plan he resolved to travel and in 1617 entered the army as a volunteer, serving successively under Maurice of Nassau, son of William of Orange, and under Tilly and Buquoy. However, the life of a soldier contributed little to his main object, and he quitted the army in 1621. After making journeys in different directions, he at last retired in 1629 to Holland, where he prepared most of his works, attracted many disciples, and at the same time became involved in several learned

controversies, especially with the theologians. A work, *Le Monde*, which he had planned to publish the latter part of 1633 he prudently suppressed when he learned of Galileo's condemnation. Although he loved independence, yet in 1649 he accepted an invitation addressed to him by Queen Christina to go to Sweden. His willingness to leave Holland was partly occasioned by his anxiety to escape from the hostility of his enemies. He died only a few months after his arrival at the court of Queen Christina. Sixteen years later his body was brought to Paris and buried in the church of Sainte-Geneviève-du-Mont.

The grand object towards which Descartes directed his endeavors was the attainment of a firm philosophical conviction. The way whereby he sought to attain this end is explained in the discourse on method (*Discours de la méthode*), published in 1637. This small but extremely interesting and important treatise contains a history of the inner life of the author, tracing the progress of his mental development from its commencement in early years to the point where it resulted in his resolution to hold nothing for true until he had ascertained the grounds of certitude. The author in the same treatise also explains the practical rules whereby he resolved to be guided while in this state of suspended belief, and by the observance of which he hoped to arrive at absolute certainty, if indeed it were at all attainable. The result of his inquiries, so conducted, he exhibited more particularly in his *Meditationes de Prima Philosophia* (1641) and the *Principia Philosophiæ* (1644). He begins philosophy anew with a resolve to doubt everything; for might not our beliefs be the result of the mischievous working of some evil demon? One fact he found indubitable—his doubting and his thinking. But in order to think he must exist; hence, in the fundamental fact of psychic experience he believed that he came into knowing contact with ultimate reality—a process of reasoning which Augustine had followed before him. In other words, he could not doubt that he felt and thought, and therefore he could not doubt that *he*, the feeler, the thinker, existed. This relation between consciousness and existence he expressed by the memorable words, *Cogito, ergo sum* (I think, therefore I exist). Upon examining the criterion for the certitude of this knowledge he found it in the clearness and distinctness of his thought about himself. Hence he argued that whatever is as clearly and distinctly thought as self-consciousness must be true. Among these clear and distinct thoughts he first recognized the idea of God as the absolutely perfect being. This idea, he reasoned, could not be formed in our minds by ourselves, for the imperfect can never originate the perfect; it must be innate, i.e., part of the original structure of our understanding, and implanted there by the perfect being himself. Hence, from the existence of the idea of perfection, Descartes inferred the existence of God as the originator of it; he inferred it also from the mere nature of the idea, because the idea of perfection involves the existence of perfection—a form of the so-called "ontological argument." Descartes's reasoning here is as follows: To think of anything as perfect is to think of it as not lacking anything valuable. But to lack existence is to lack something valuable. Hence, to think of anything as perfect is

to think of it as existing. We cannot think of the perfect except as existing. We must think of God, therefore, as existing. But if God exist, then we have a guarantee of the previously determined ground of certitude, for God the perfect being cannot deceive, and therefore whatever our consciousness clearly testifies may be implicitly believed. This Cartesian position, that the truth of a proposition is tested by its clear and distinct intelligibility, is the principle of rationalism (q.v.).

One of the most fundamental general principles of the philosophical system of Descartes is the essential difference between spirit and matter—thinking and extended substances—a difference so great, according to Descartes, that they can exert no influence upon each other. Hence, in order to account for the correspondence between material and spiritual phenomena, he was obliged to have recourse to a constant coöperation (*concursum*) on the part of God—a doctrine which gave rise subsequently to the system called occasionalism (q.v.), the principle of which was that body and mind do not really affect each other, God being always the true cause of the apparent or occasional influence of one on the other. This doctrine received another development in the preëstablished harmony of Leibnitz (q.v.). In Descartes's thought it resulted merely in a strenuous insistence upon the differences between primary and secondary qualities (q.v.). Descartes maintained also that the lower animals belong merely to the world of extension, being unconscious automata. See DUALISM; AUTOMATISM.

Descartes did not confine his attention to mental philosophy, but devoted himself systematically to the explanation of the properties of the bodies composing the material universe. In this department his reforms amounted to a revolution, though many of his explanations of physical phenomena are purely a priori and quite absurd. His corpuscular philosophy—in which he endeavored to explain all the appearances of the material world simply by the motion of the ultimate particles of bodies—was a great advance on the system held up to that time, according to which special qualities and powers were assumed to account for every phenomenon. It was in pure mathematics, however, that Descartes achieved the greatest and most lasting results, especially by his invention of the analytic geometry, which is known from his name as Cartesian. In developing this branch of mathematics he had in mind, not the revolutionizing of geometry, but the elucidation of algebra by means of geometric intuition and concepts. He intended to establish a universal mathematic, to which algebra, arithmetic, and geometry (with its applications) should be entirely subordinate. He discarded Vieta's improvements in algebraic symbolism, introduced the present plan of representing known and unknown quantities, gave standing to the present system of exponents, placed the theory of negative quantities on a satisfactory basis, and set forth without demonstration the well-known rule for finding the limit of the number of positive and negative roots of an equation through inspection of the variations in the signs. While his expectations were, in one sense, not fulfilled, he nevertheless succeeded in imparting a powerful impulse to the progress of mathematics and in

giving to the science its modern trend. The establishment of a correspondence between geometry and analysis has been of incalculable assistance to both, and Descartes's invention may be said to constitute the point of departure of modern mathematics. In 1637 he published at Leyden a treatise entitled *Discours de la méthode pour bien conduire sa raison et chercher la vérité dans les sciences* (Eng. trans. 1850; recent ed., Chicago, 1903). This was followed in the same year by three appendices entitled *La dioptrique*, *Les météores*, and *La géométrie*. The new mathematical discipline was set forth entirely in the *Géométrie*. The first part shows how arithmetical operations may be represented geometrically by taking a certain unit of length, in which lay the sole novelty of the plan. The second part shows how to trace algebraic (which he calls geometric) and transcendental (which he calls mechanical) curves, explaining the use of coordinates and setting forth the general scheme (now discarded) of classification of curves according to the order of their equations. The third part treats of the theory of equations. The appearance of the *Géométrie* placed Descartes foremost among the mathematicians of his time.

His works in Latin were published at Amsterdam (1650). Modern editions of his collected works are those by Cousin (Paris, 1824-26), and by Adam and Tannery (ib., 1897-1910) in 12 vols., the last being devoted to an historical study of Descartes's life and works by Adam. English translations of portions have been made by Veitch (Edinburgh, last ed., 1907), by Lowndes (London, 1878), and by Torrey (New York, 1892). Consult. Mahaffy, *Descartes* (Edinburgh, 1881); Millet, *Descartes, sa vie, ses travaux, etc.* (Paris, 1867). Fouillée, *Descartes* (ib., 1893); Fischer, *Geschichte der neuern Philosophie*, vol. i (Heidelberg, 1897); Boutroux, *L'Imagination et les mathématiques selon Descartes* (Paris, 1900); Smith, *Studies in Cartesian Philosophy* (London, 1902); Iverach, *Descartes, Spinoza, and the New Philosophy* (New York, 1904); Hoffmann, *René Descartes* (Stuttgart, 1905); Haldane, *Descartes. His Life and Times* (London, 1905).

**DESCARTES'S RULE OF SIGNS.** According to this rule no numerical algebraic equation can have more positive roots than it has changes of sign from  $+$  to  $-$  and from  $-$  to  $+$  in the terms of the first member. By substituting  $(-x)$  for  $(x)$  in  $f(x) = 0$ , the law may be applied to the case of negative roots. It is often possible to detect the existence of imaginary roots in equations by the application of this rule; for if it should happen that the sum of the greatest possible number of positive roots, added to the greatest possible number of negative roots, is less than the degree of the equation, we are sure of the existence of imaginary roots. The rule also bears Harriot's name, being given in his *Artis Analyticae Praxis* (London, 1631). Consult Burnside and Panton, *Theory of Equations* (Dublin, 1899-1901), and Matthiessen, *Grundzüge der antiken und modernen Algebra der literalen Gleichungen* (2d ed., Leipzig, 1896). See DESCARTES.

**DESCAVES, dá'káv',** LUCIEN (1861- ). French novelist and playwright, born in Paris. In 1900 he was elected a member of the Académie of the Goncourts. His novels include: *Le*

*calvaire d'Héloïse Payadou* (1882); *Les sous-offs* (1889); *Les emmurés* (1894); *La colonne* (1901). For the stage he wrote: *La Clavière* (1899), with Donnay, and *L'Attentat* (1906), with Capus; *La Préférence* (1907); *La vie douloureuse de Marceline Desbordes-Valmore* (1910).

**DESCENDANTS** (from Lat. *descendere*, to descend, from *de*, down + *scandere*, to climb, Skt. *skand*, to spring). The issue of an individual, including all who have proceeded or descended from the issue of his body in any generation or degree. By American as well as English law, descendants take precedence over collateral relations and ascendants (q.v.) in the inheritance of the property of a deceased ancestor. See COLLATERAL; CONSANGUINITY; DESCENT. HEIR.

**DESCENT.** The transmission of real property by operation of law to the heir or heirs of one who dies intestate. It is a principle common to most if not all legal systems, that the property of a decedent, if not otherwise disposed of by him, shall pass in a fixed line of descent to those related to him by ties of blood. Under some systems, as that of Rome, no distinction was made between the two classes of property which we distinguish as real and personal, the whole passing, along with the liabilities of the owner, to a personal representative, and this has been the nature of descent generally, both in ancient and in modern nations. In the common-law system of England and the United States, however, a different principle has prevailed, only the personal property passing to the representative of the deceased, the real property devolving upon a descendant, who became known as the heir. The personal representative was not necessarily a descendant, nor even related by any ties of consanguinity to the decedent, and the use of the term "descent" was therefore confined to the devolution of the real property—the terms "administration" and "distribution" being employed to describe the corresponding disposition made of the personal property after the owner's death. The transmission of the real property to a different individual from the one whose title, as personal representative, was affected with the obligation to pay the decedent's debts, was a consequence of the feudal system, and was due, among other things, to the necessity of holding the lands together, free from claims on the part of others than the feudal lords of whom the lands were held.

The exceptional and peculiar character of the law of land at the common law, due to its complete absorption in the feudal system, is strikingly exemplified in the history of the doctrine of inheritance. There was at first no general recognition of the right to transmit freehold lands by descent, nor to alienate them without the consent of the lord of whom they were held, and the right to dispose of one's real estate by will was not conceded until the reign of Henry VIII. The right of inheritance, once acquired, was strictly limited to freeholds which were in terms granted to a man and his heirs, and did not extend to such as were granted to a man absolutely, but without an express limitation to heirs. The latter, therefore, fell into the category of life estates, while the quality of heritability became the chief characteristic of the estate known as a fee. Thenceforth freehold estates were classified as "freeholds of inheritance" and "freeholds not of inheritance." It is with

the former, only, that the law of descent has to do. The right of free alienation of lands held in fee was not acquired until the quality of heritability had come to be considered an essential characteristic of such lands, and such alienation was long regarded as an infringement upon the expectant rights of the heir as well as upon the reserved rights of the lord of whom the fee was held. To-day, however, no fee can exist without possessing both the quality of free alienability and that of heritability within the limits prescribed by the laws of descent, and an attempt to create a fee which shall lack either of these characteristics is ineffectual and void.

The exigencies of the feudal system determined the course as well as the fact of descent at common law. The importance of holding an estate together, in the hands of a single heir, and that a male, nearest in blood to the decedent, fixed the canons of descent as they existed in England from the twelfth to the nineteenth century. Originally, it is true, and down to the time of Glanville (twelfth century), lands held by the tenure of free and common socage were governed by different rules from those which regulated the inheritance of military fees, or lands held by knight's service, and on the ancestor's death were divided among all his sons equally; but long before the time of Littleton this distinction had disappeared and all lands held in fee simple came under the operation of the feudal rules.

Briefly stated, these rules were as follows: 1. Inheritances shall lineally descend to the issue of the person who last died actually seised thereof, *in infinitum*, but shall never lineally ascend. A father or mother cannot inherit directly from a son or daughter. 2. The male issue shall be admitted before the female, to the total exclusion of the latter. 3. Where there are two or more males in equal degree of consanguinity to the ancestor, the eldest only shall inherit; but, there being no male of equal degree, the females inherit all together. 4. The lineal descendant *in infinitum* of any person deceased, who, if he had survived, would have been the heir, shall represent their ancestor, i.e., shall stand in the same place in the line of descent as he would have occupied, if living. Thus, the issue, whether male or female, of the eldest son will be preferred to the younger son or the daughter of the deceased ancestor. 5. On failure of lineal descendants, or issue, of the person last actually seised of the lands, the inheritance shall pass to his collateral relations of the blood of the first purchaser (i.e., of the first in the line of ancestors to transmit it by descent, having acquired it himself in some other way), on the same terms as to preference of males, primogeniture, etc., as it would have passed to issue if there had been any. Thus, an elder brother, or his issue, will take the inheritance to the exclusion of sisters and younger brothers. 6. The collateral heir of the person last seised must be his next collateral kinsman of the whole blood. The half blood is wholly excluded from the line of descent. 7. In collateral inheritances the male stocks shall be preferred to the female; i.e., kindred derived from the blood of the male ancestors, however remote, shall be admitted before those from the blood of the female, however near, unless, indeed, the lands have descended from a female ancestor, in which case the rule is reversed and the female stock preferred to the male.

These common-law rules of descent have been changed in some important respects by the Inheritance Act (3 and 4 Wm. IV, c. 106). The famous rule of primogeniture, embodied in the second canon and the first part of the third, remains unchanged, notwithstanding its complete rejection by the United States and the self-governing colonies of Great Britain as well as by the nations of continental Europe. The second half of the second canon and the seventh also remain unaltered. The first has been changed by deriving the descent from the last purchaser instead of the person last actually seised, and by admitting lineal ancestors in default of lineal descendants and in preference to collateral heirs. The sixth canon has also been altered by admitting collateral relations of the half blood in default of relations of the whole blood in the same degree.

So far as they are applicable, these common-law rules of descent govern all common law, as distinguished from customary inheritances, including the descent of fee-tail estates. These are the result of legislation of the end of the thirteenth century, and, as they are expressly limited to heirs of the body, i.e., to lineal descendants only, the rules relating to collateral inheritance have no application to them. Even the canons governing lineal inheritances, however, may be varied by the form of the fee tail, as a fee tail special, which confines the inheritance to the issue of a certain wife, a fee tail male (which may be general or special) which limits descent to the male issue, etc.

So, too, while the common-law rules have to a great extent come to be applied to copyhold estates, whose qualities are largely determined by local custom, they have no application whatever to certain other classes of customary estates. Thus, lands held by the custom of gavelkind (q.v.), which is the prevailing tenure in Kent and which occurs elsewhere, are still governed by the old rule of socage tenure and pass to the sons of the decedent equally, while in the case of lands held by the ancient tenure of borough English (q.v.) the common-law rule of primogeniture is reversed, and the inheritance passes to the youngest son. And it may be said, in general, that in many manors and boroughs in England the course of descent of certain lands may still be governed by local customs of great antiquity, which have successfully resisted the encroachments of the feudalized common-law doctrine.

In the United States there is much diversity in the law of inheritance. The course of descent is everywhere regulated by legislative enactment, and the statutes of the several States must be consulted by any one who desires to master its details. But there is a general and essential uniformity in the outlines of the law governing the matter throughout the nation.

In the first place, the law of the descent of real property has generally been kept distinct from that of the distribution of personal property, and the heir from the personal representative. In the second place, the descent of real property is still confined to those who are of the blood of the decedent, excepting in a few States in which the wife and the husband have been placed in the line of inheritance. In the third place, the principle of priority according to the degree of consanguinity has been preserved, the relatives of one degree not being entitled to share in the inheritance if there is any

representative of a higher degree living. In the fourth place, the rules in accordance with which the degree of consanguinity of collaterals is computed have generally in the United States been changed to those of the civil law, being the aggregate of both parties from the common ancestor.

On the other hand, as has been said before, the rule of primogeniture has been universally rejected in the United States, and with it the feudal preference of the male over the female heir. All the children of the decedent, and all the relatives of equal degree, share alike, usually as tenants in common, without distinction of age or sex. Generally, also, the disability of the half blood has been wholly or partially removed, and half brothers and sisters permitted to share equally with those of full blood, or, as now in England, admitted immediately after the latter. In all States the father and mother, and in some States all lineal ancestors, are admitted to the inheritance, usually immediately after lineal descendants and before the collaterals. The principle of representation has also been retained, but in general the descent is traced, not from the person last actually seised, as at common law, nor from the last purchaser, as under the present English statute, but from the person last entitled. The canons of descent, as given above from Blackstone, do not in terms exclude illegitimate children, but no principle of the common law is better established than the rule which denies the right of inheritance to a bastard; only persons born in lawful wedlock are within the legal limits of consanguinity, and no others are capable of lineal or collateral inheritance. This principle has been maintained in all its rigor in England and has been generally observed in the inheritance laws of the United States, but with the following exceptions and modifications. In most of the States illegitimate children inherit from the mother equally with legitimate children, in one State (New York) only in case the mother has no legitimate issue, and in one (Kansas) from the father also, if his recognition of them is notorious. In many of the States the milder rule of the civil and canon laws, that the subsequent marriage of the parents legitimates previously born children, has been adopted.

It remains to be said that the law of descent of a given jurisdiction is immutable and not to be varied by any form of grant or conveyance. An estate may, indeed, be taken out of its operation by previous conveyance or by last will and testament, but if real property be left undisposed of it passes according to an iron law of inheritance and not otherwise. No limitation of an estate to a different class of heirs, no provision excluding an individual or a class of individuals, has any validity. To attempt to create a different line of descent from that established by law, as by granting lands to A and his male heirs only, or to B and his paternal line only, is to undertake the creation of a novel kind of estate, unknown to the law and therefore not to be tolerated. Such a conveyance, if it creates an estate of inheritance at all, is at once subjected to the established rules of descent and the particular restrictions imposed by the donor disregarded. The only exception to this principle is the case of the fee-tail estate, referred to above, and that is only an apparent and not a real exception, the qualities of the various kinds of fees tail being as clearly defined as are those of the ordinary

estate in fee simple. Consult: Blackstone, *Commentaries on the Laws of England*; Williams, *Principles of the Law of Real Property* (17th (International) ed., London and Boston, 1894; 19th Eng. ed., 1901); Jenks, *Modern Land Law* (Oxford, 1899); Digby, *An Introduction to the History of the Law of Real Property* (5th ed., ib., 1899); Pollock and Maitland, *History of English Law* (2d ed., Cambridge and Boston, 1899); Washburn, *Law of Real Property* (6th ed., Boston, 1902). See DISTRIBUTION; EXECUTOR; HEIR; INHERITANCE; and the titles of the various kinds of estates, as FEE SIMPLE; FEE TAIL; ETC.

**DESCENT CAST.** A doctrine of the ancient common law in England, whereby the right of entry of a person who had been disseised of lands was barred by the death of the adverse holder and the descent of the lands to the latter's heir. Entry upon lands was formerly by far the most convenient and expeditious method of recovering them from a disseisor, but so important in legal effect was the fact of actual possession by him, however wrongful, that he was invested with an inheritable title, and the passing of this title by descent operated as a limitation upon the right of entry of him who had been disseised. In the technical language of the common law, "a descent cast tolls [i.e., bars] entry." This effect of a descent cast might be avoided by the procedure known as making continual claim, which consisted in an annual demand for possession made by the claimant upon the disseisor. If such claim was made within a year and a day of the disseisor's death, the right of entry of the disseisee was saved. A descent cast had no effect upon the right of a claimant of lands to pursue his remedies by action, but only upon the summary process of entry. See ENTRY, RIGHT OF; DISSEISIN; LIMITATION.

**DESCHAMPS**, dâ'shân', EMILE DE SAINT-AMAND (1791-1871). A French poet, born at Bourges. To forward the cause of romanticism, he founded with Victor Hugo *La Muse Française* (1824). To this journal he contributed verses and stories signed "Le Jeune Moraliste." Four years afterward he collected and published *Etudes françaises et étrangères* (1828), consisting of poems and translations. The preface of this book, an enthusiastic defense of the Romantic school, won the approval of Goethe. His other publications include: *La paix conquise* (1812), an ode which won the praise of Napoleon; *Contes physiologiques* (1854); *Réalités fantastiques* (1854). His *Œuvres complètes* were published in 6 vols. (1872-74).

**DESCHAMPS**, EUSTACHE (called MOREL because of his dark complexion) (c.1340-c.1410). A French poet. He was born at Vertus, studied law at Orléans, and was appointed bailli of Senlis by the Emperor Charles VI. His life was that of a popular trouvère. His verse, like most of that of his time, is quite artificial and possesses chiefly an historical value. One of his ballads is addressed to Chaucer. In addition to ballads and rondeaus, he wrote a *Miroir de mariage* in 13,000 lines, which contains the prototype of the mother-in-law so frequently found in French farces, and *De l'art de dicter*. His *Œuvres complètes* were edited by Saint-Hilaire (11 vols., 1878-1903). Consult E. Hoepfner, *Eustache Deschamps* (Strassburg, 1904).

**DESCHANEL**, dâ'shâ'nêl', EMILE AUGUSTE ETIENNE MARTIN (1819-1904). A French critic and author, born in Paris. He became professor of rhetoric at the Normal School there, and the contributor of critical articles to the *Revue des Deux Mondes*. His essays on *Catholicisme et socialisme* (1850) brought him into difficulties with the government. He was arrested following the coup d'état of Dec. 2, 1851, and was expelled from France. He took refuge in Belgium, where he met Victor Hugo. On his return to his native country Deschanel became one of the editors of the *Journal des Débats* (1859). He was elected deputy in 1876 and reelected in 1877. In 1881 he was made professor of modern literature in the Collège de France and in the same year was elected a senator. His works include: *Les courtisanes grecques* (1859); *Histoire de la conversation* (1857); *Etudes sur Aristophane* (1867); *Le romantisme des classiques* (1882; 2d ed., 1883); *Racine* (1884); *Le théâtre de Voltaire* (1886); *Lamartine* (1893).

**DESCHANEL**, PAUL (EUGÈNE LOUIS) (1856- ). A French statesman and author, born in Brussels, where his father, Emile (1819-1904), a former senator, had been exiled for opposition to Napoleon III. He was secretary to Marcères and to Jules Simon, and entered the administration as Vice Prefect in 1877. As an orator in the Chamber of Deputies, to which he was first elected in 1885, he displayed great eloquence. He was a leader of the Progressist Republicans and a strong exponent of the separation of church and state. From 1898 to 1902 he was President of the Chamber, and being again chosen to this office in 1912, he was reelected in 1913 and 1914. In 1899 he was elected to the French Academy, and in the same year he received 10 votes (Loubet, 483) for President of the Republic. He wrote: *La question du Tonkin* (1883); *La politique française en Océanie* (1884); *Les intérêts français dans l'océan pacifique* (1887); *La décentralisation* (1895); *La question sociale* (4th ed., 1898); *La république nouvelle* (3d ed., 1898), a collection of speeches; *Politique intérieure et étrangère* (1906).

**DESCHUTES** (dâ'shûot') RIVER (Fr., the falls). A river which rises in the Cascade Range in Klamath Co., Oreg., flows north by east through Crook and Wasco counties, and empties into the Columbia River (Map: Oregon, D 5). It is about 320 miles long, and for 140 miles of its course it cuts into the great lava bed of the Northwest. The river has made a cañon, ranging from 1000 to 2500 feet in depth and exposing on its sides at least 130 layers of lava one above another.

**DES CHUTES INDIANS.** See WARM-SPRING.

**DES CLOIZEAUX**, dâ klwâ'zô', ALFRED LOUIS OLIVIER LEGRAND (1817-97). A French mineralogist, born at Beauvais (Oise). After scientific study and travel he was appointed assistant instructor in the Ecole Centrale des Arts et Manufactures and subsequently lecturer at the Ecole Normale. He was elected in 1869 to the Academy of Sciences. In 1876 he became professor of mineralogy at the Muséum d'Histoire Naturelle. He made important investigations in regard to the optical properties of crystals, particularly with a view to establishing a basis for a crystallographic system, and discovered the triclinic potash feldspar known

as microcline (KAlSi<sub>3</sub>O<sub>8</sub>) and the circular polarization of cinnabar. He published: *Leçons de cristallographie* (1861); *Manuel de minéralogie* (2 vols., 1862-93); *Nouvelles recherches sur les propriétés optiques des cristaux* (1867).

**DESCLOT**, dê-sklô' (DESCLOS, DES CLOT, ESCLOT, SCLOT), BERNAT. A Catalan historian in the latter half of the thirteenth century. He wrote a *Libre del rey En Pere*, the oldest important composition in the Catalanian language. While as an historical narrative it is skillful and reliable, its chief interest is linguistic. The original text was first published and edited by Buchon under the title *Chroniques étrangères relatives aux expéditions françaises pendant le treizième siècle* (Paris, 1841), although it had appeared (in Barcelona) in a Castilian translation by Rafael Cervera as early as 1616, and (in Madrid) in a second Castilian edition in 1793.

**DESCRIPTIVE GEOMETRY.** See GEOMETRY; MONGE.

**DESDÉMONA.** The young wife of Othello in Shakespeare's tragedy of the latter title, smothered by her jealous husband at the instigation of Iago. This is said to be the first character impersonated by an actress on the English stage.

**DESDÉN CON EL DESDÉN**, dâs-dân' kôn ël dâs-dân', E. (Sp., Disdain with Disdain). A play by Moreto, produced about the middle of the seventeenth century. It was translated into English by Westland Marston (1864), from the German version of Schreyvogel.

**DE SENECTUTE** (Lat., On Old Age), or **CATO MAJOR.** A popular essay by Cicero, applying the principles of philosophy to the endurance of the ills incident to old age. It was composed in 45 or 44 B.C., and is dedicated to Atticus. Scipio and Lælius are represented as meeting at the home of the elder Cato, in 150 B.C., and admiring the manner in which he bears his age.

**DESERET**, dêz'êr-ët, STATE OF. The name given by the Mormons in 1849 to their settlement in the present State of Utah, *deseret* being a word taken from the Book of Mormon and meaning "land of the honeybee." In September, 1850, Congress created the Territory of Utah, and the old name gradually fell into disuse. See UTAH; MORMONS.

**DESERONTO**, dêz'êr-ôn'tô. A town of Hastings Co., Ontario, Canada, the best harbor on the Bay of Quinte, an inlet of Lake Ontario, 130 miles east of Toronto (Map: Ontario, G 5) and 200 miles west of Montreal. It is on the Canada Northern Railway, which connects it with the Grand Trunk and the Canadian Pacific railways. It also has steamship connection with all Canadian and American ports on the St. Lawrence River and the Great Lakes. The manufactories include a blast furnace, cannery, machine shop, and saw mills, and their products are boxes, cars, matches, sashes and blinds. Abundant supplies of lumber and fruit are in the surrounding district. The town owns the gas, sewerage, and water systems. The United States is represented by a consular agent. The beautiful Foresters' Island Park is near Deseronto. Pop., 1901, 3527; 1911, 2013.

**DESERT**, dêz'êrt (Fr. *désert*, Lat. *desertum*, from *deserere*, to abandon, from *de*, from + *serere*, to bind). A region which supports little plant and animal life. As thus defined, the term includes all barren areas, whether their barren-

ness is caused by intense cold, lack of soil, or by insufficient moisture. Greenland, southern Patagonia, and the Arctic and Antarctic lands in general are deserts, determined as to character by their situation in high latitudes. In common usage, however, the term is limited to the great continental wastes lying within the tropical and temperate zones which are scantily watered by rains. The most extensive of these arid deserts are found in Asia, Africa, and Australia; they are much less extensive in area in North and South America, and in Europe they scarcely occur. The Sahara Desert is a part of an arid belt that reaches from the Atlantic coast across the northern limb of Africa to the Red Sea and is continued through Arabia, Persia, Turkestan, Sungaria, and Mongolia, almost to the Pacific shores of Asia. The eastern extension of this belt, which is wider than the central portion, is known as the Desert of Gobi. In South Africa the Kalahari Desert occupies a large area between the Zambezi River on the north and the Orange and Limpopo rivers on the south. The arid regions of Australia are situated in the central part of the continent and are of vast extent. The Atacama Desert, in northern Chile, and the Colorado Desert, in California, are of comparatively limited area, but they furnish perhaps the best illustrations of regions in America having an arid climate.

The arid deserts vary greatly in surface conformation, and often they are far from having the monotonous character which popular imagination has ascribed to them. The Sahara Desert consists essentially of a series of elevated plains rising in terraces to altitudes of several thousand feet. Within its compass there are sandy stretches with the surface formed by the winds into shifting dunes, and great areas underlain by stratified rocks, where the surface is strewn with boulders and has been deeply eroded by the rivers that existed in past ages. Oases are found at intervals in deserts wherever there are natural springs or mountains of sufficient height to cause precipitation. The date palm and other food plants may flourish here, while in the less favored regions the plant life is limited to representatives of the more hardy families, such as cacti and artemisia. Under exceptional conditions, such as exist, e.g., in parts of the Sahara, artesian wells may supply water for irrigation; such supplies are found in porous strata like sandstones that come to the surface in some remote region of plentiful rainfall. The dryness of the desert climate and the scanty vegetation give rise to rock sculpturing in columnar, tabular, and fantastic forms. Violent windstorms, accompanied by whirlwinds, cloudless skies, extraordinary heat by day and rapid fall of the temperature at night, and an annual rainfall that varies from a few inches to an immeasurably small amount, are characteristic meteorological features.

The small rainfall, upon which the aridity of deserts depends, is due to the following causes: prevalence of dry winds; isolation by mountain barriers along the borders; great distance from areas of evaporation, or oceans. The Sahara is an illustration of a desert caused by dry winds. In the northern part the prevailing winds blow from the northeast, and rain falls only in winter, when cyclonic storms from the Atlantic pass over the region. The moist winds that have their source in the Gulf of Guinea bring rain to the southern Sahara, but in small amounts only,

as their temperature—and consequently their capacity for holding moisture—is increased before they reach far into the interior. A similar condition prevails in the Desert of Atacama, where the prevailing winds are from the south. When mountain ranges occupy the borders of a region, the winds are deprived of their moisture before they pass beyond the interior slopes. Thus, the Kalahari Desert receives a very small rainfall from the east winds, which bring an abundance to the region lying between the South African highlands and the Indian Ocean. In America the arid region of Nevada, Utah, and Arizona is shut in from the Pacific Ocean by mountains. Finally, desert conditions may prevail in regions situated at great distances from oceans, owing to the gradual precipitation of moisture as the winds travel inland. The exploration of the deserts of Central Asia by Sven Hedin, Huntington, and others has brought to light numerous evidences of ancient cultivations which would appear to indicate that the present dry climate is a relatively recent development. This circumstance may be explained perhaps as the result of the evaporation of former lakes which came into existence during the Glacial epoch, and which for a long time thereafter may have provided sufficient moisture to give a moderate rainfall to that section. Consult Neumayr, *Erdschichte* (Leipzig, 1895), and Walther, *Das Gesetz der Wüstenbildung in Gegenwart und Vorzeit* (Berlin, 1900).

**DESERTED VILLAGE, THE.** A poem, partly descriptive and partly declamatory, by Goldsmith (1770). See AUBURN.

**DESERTION.** A military offense, consisting in abandoning the service with the intention of not returning to it. To prove this offense it is necessary to show absence without leave and the intention not to return. The maximum penalty for desertion in time of war is death. In time of peace it is dishonorable discharge and confinement at hard labor for not more than two and one-half years in the most aggravated cases. The Act of April 27, 1914, permits the suspension of that part of the sentence directing dishonorable discharge until the soldier's release from confinement. This affords the soldier an opportunity to earn restoration to the colors by good behavior while in confinement. In cases of soldiers earning restoration that part of the sentence directing dishonorable discharge will be remitted before it is executed and the soldier restored to duty to complete his enlistment. The United States government pays a reward of \$50 for the arrest, securing, and delivery of a deserter. This reward is payable to any civil officer or citizen who makes the arrest and is also payable when information and assistance is given which directly enables military authorities to make such arrest. A soldier who has deserted, and whose period of service has elapsed prior to his apprehension, is handed over to the military authorities for trial and sentence by a military court-martial, provided a period of two years, the extent of the period fixed by the Statute of Limitations, has not elapsed since the expiration of his enlistment.

In the British army desertion is a common offense, although in the majority of instances the soldier deserts to join another regiment immediately, in which case, should he confess or be discovered, he is tried by a district court-martial on the charge of fraudulent enlistment. Formerly the charge was "desertion and fraudulent

enlistment," and up to 1879 the rule was to brand a deserter by tattooing him with the letter D or B. C. (bad character). The punishment for a first offense is usually from three months' to two years' imprisonment in a military prison, and for succeeding offenses not more than five years may be inflicted. In Germany and continental Europe generally desertion in time of peace is difficult, and consequently infrequent, owing to the compulsory-service system which prevails. Desertion in time of war is treated by all countries alike, death being the usual punishment. Desertion from the naval services of European nations is also treated with varying terms of imprisonment, or the death penalty, according to the nature and circumstances of the offense.

In the United States navy absence without leave, with a manifest intention not to return, is always regarded as *desertion*. Absence without leave, with the probability that the person does not intend to desert, is at first regarded as *straggling*, and at the expiration of 10 days, if still absent, as *desertion*. In either case the commanding officer decides the point of intention and causes the person's name to be entered in the ship's log book and marked on the paymaster's books as a *deserter*. Commanding officers are authorized to offer a reward not exceeding \$20 for the recovery of a deserter, and one not exceeding \$10 for the recovery of a straggler. In addition to the reward there are paid such expenses attending their lodgment, subsistence, and traveling as have been fairly incurred. Any reward paid for the apprehension and necessary expenses of a straggler is charged to his account. The wages due a deserter are forfeited to the United States; if in debt to the government at the time of his desertion, his effects are sold and the proceeds applied to liquidate it. The letter R marked against a person's name on the ship's books signifies desertion, and no application for its removal is entertained unless the department is furnished with sufficient evidence that there was no intention to desert. Commanding officers of vessels at any United States naval station are not allowed to receive on board stragglers or deserters from other vessels, unless ordered so to do by the Bureau of Navigation, which has charge of the recruiting of the navy. In case of shipwreck or any other circumstance, except capture by an enemy, whereby any person belonging to a vessel in the navy becomes unavoidably separated from his command, it is his duty to proceed at once to the nearest ship, squadron, or station, and report himself to the officer in command. Should he not do so, he is regarded as a deserter, and no claim for wages is allowed unless he can prove that he was prevented by circumstances beyond his control. The punishment of death, or such other punishment as a court-martial may adjudge, can be inflicted on any person in the naval service who in time of war deserts or entices others to desert. In the merchant service absence without leave for 48 hours is regarded as conclusive evidence of desertion.

**DESERTION.** As applied to marital relations, the willful withdrawal of one of the married parties from the other, or the voluntary refusal of one to renew a suspended cohabitation without justification either in the nonconsent of the other party or the wrongful conduct of that party. In most of the States in this country willful desertion is made by law

a cause of divorce. The statutes of the several States define what may be considered desertion and usually declare the length of time after which desertion will be deemed a good cause for divorce. This time varies from one year to five. In some States it has been held that willful abandonment of his wife by a husband will justify an action for divorce, even though he had continued during the period of his desertion to support her. In England, under the law at present in force, the wife is entitled to a decree of judicial separation, coupled with an order for alimony, on account of willful desertion by the husband for two years without cause, while either spouse may for willful desertion of the other maintain an action against the offender for the restitution of conjugal rights. See CONJUGAL RIGHTS; DIVORCE; HUSBAND AND WIFE, and the authorities referred to under the last-named title.

The desertion of children or other dependent persons is dealt with under the head of ABANDONMENT.

**DESERT VEGETATION.** Plants whose natural habitats are in deserts. They form one of the three great climatic groups of xerophytes and show the typical xerophytic structures and organs which need but brief statement here. Most of the modifications secure reduced transpiration—e.g., many plants show reduced leaves—or the leaves may even be wholly absent, as in some cacti; the deciduous habit is pronounced and reaches its highest expression in annuals, where the whole plant, so to speak, is shed during the dry season; anatomical structures, such as thick cuticles, coats of hair and also wax, protected stomata, etc., are highly developed. Adaptations which secure increased absorption are often found—e.g., root systems are highly developed—and absorptive hairs sometimes occur. Possibly the most characteristic of all desert responses are storage organs; succulent leaves and stems are particularly common, and there are many plants with fleshy underground stems (bulbs, tubers, etc.). The conditions that determine the nature of the vegetation are largely associated with the small amount of atmospheric moisture and its seasonal distribution. Most deserts are in semitropical regions, and hence the xerophytic conditions are accelerated by intense heat and light. The loss of water by evaporation rather than by drainage often gives rise to alkaline soils, which still further intensify the xerophytic characters. See HALOPHYTES.

The vegetation of deserts is characterized by monotony rather than poverty, there being but few species that can endure the severe conditions. The plants are scattered so that the soil gives the landscape tone. In comparing desert plants with Alpine and Arctic plants, many ecological differences are seen; the most striking are the deciduous and succulent habits—habits particularly adapted to regions where drought is the result of heat. Floristically deserts are noted for their endemism (q.v.), agreeing in this with Alpine, but disagreeing with Arctic, vegetation. The endemism of deserts is due in part to their geographic isolation; mountains and other barriers commonly cut off deserts on all sides and prevent effective migration. However, another factor which favors endemism is the intense modification that desert plants have undergone as a result of the severe conditions. See XEROPHYTES.

**DESÈZE, de-zâz',** RAYMOND, COUNT (1748-

## DESERT PLANTS

1. PRICKLY PEAR CACTUS (*Opuntia*), covering the surface of an Arizona desert.

2. ARTEMISIA AND CACTUS. Scene in an Arizona desert, showing the bushy greasewood and sage-brush (*Artemisia*), and the columnar giant cactus (*Cereus*).

1828). A French lawyer. He was born and educated in Bordeaux and in 1784 became established in Paris, where, together with Malesherbes and Trouchet, he was subsequently entrusted with the defense of Louis XVI before the National Convention. Owing to the splendid oratory which he displayed on that occasion, he fell under suspicion of sympathizing with the royal cause and was imprisoned until the fall of Robespierre. He did not avail himself of the opportunities of advancement offered him by Napoleon, but remained faithful to the house of Bourbon, and upon the installation of Louis XVIII was appointed president of the Court of Cassation and grand warden of the royal orders.

**DESFONTAINES**, dā'fōn'tān', PIERRE FRANÇOIS GUYOT (1686-1745). A French writer, born in Rouen. He entered the Jesuit Order and became professor of rhetoric in Bourges, but soon resigned and was editor of the *Journal des Savants* (1724-27). He wrote *Observations sur les écrits modernes* (1735), a shallow performance, yet so stinging that Voltaire bitterly replied in a *Critique des observations* (1738). Desfontaines countered with *La Voltairomanie* (1738), and then *Le médiateur* (1739). His *Dictionnaire néologique* (6th ed., 1750), likewise aroused Voltaire's ire.

**DESFONTAINES**, RENÉ LOUCHE (1750-1833). A French botanist, born in Tremblay. In 1783 he was elected a member of the Academy of Sciences, by which he was commissioned in the same year to explore the Barbary States. In 1786 he became director of the botanical gardens in Paris, which he greatly improved. His works comprise *Flora Atlantica* (1798-1800), compiled from his North African studies, and an *Histoire des arbres et arbrisseaux qui peuvent être cultivés en pleine terre sur le sol de la France* (1809).

**DESFORGES**, E. D. See PARNY, VICOMTE DE.

**DESFOSSÉS**, dā'fō'sā', ROMAIN JOSEPH (1798-1864). A French admiral, born at Gouesnon (Finistère). In 1830 he was appointed captain, in which capacity he participated in the capture of Algiers. He was also a member of the expedition against Mexico in 1838 and commanded a vessel at San Juan d'Ulloa. In 1844 he arranged a treaty of commerce with Muscat and later conducted a punitive expedition against Madagascar. He became rear admiral in 1848, Minister of Marine in 1849, vice admiral and member of the Admiralty Council in 1853, and chairman of the Council of Naval Construction in 1854. As commander of the Mediterranean fleet, he bombarded the forts at the entrance to the Tetuan River in 1859 during the conflict between Morocco and Spain. In the following year he was promoted to the rank of admiral.

**DESGENETTES**, dā'zhe-nēt', NICOLAS RENÉ DUFRICHE (1762-1837). A French physician, born in Alençon. He was made physician in chief to the army in Italy in 1794 and occupied the same position in the Egyptian campaign. He went afterward to Spain and Russia with the French army and was present at Waterloo. His works include: *Analyse du système absorbant ou lymphatique* (1792); *Histoire médicale de l'armée de l'orient* (1802); *Souvenirs de la fin du XVIII. et du commencement du XIX. siècle* (1835-36).

**DESGOFFE**, dā'gōf', BLAISE ALEXANDRE (1830-1901). A French painter of still life. He was born in Paris and studied there under

Flandrin and Bougereau. His specialty was still life and objects of art, as, e.g., vases and ivories from the collection in the Louvre, grouped together with, perhaps, fruit or flowers. Hamerton calls them "precious copies of precious things." In the Luxembourg there is the study of an "Amethyst Vase of the Sixteenth Century" (1859) by him, and in the Corcoran Gallery, in Washington, are his "Souvenirs of the Sixteenth and Seventeenth Centuries." He is also represented in the Metropolitan Museum, New York; the Walters Gallery, Baltimore; the Brooklyn Museum, and many private collections in America. He renders texture, material, metals, and jewels with peculiar felicity and microscopic detail, but is less successful with fruit.

**DESHAYES**, de-zā', GÉRARD PAUL (1795-1875). A French geologist and conchologist. He was born at Boran (Oise), studied in Strassburg and Paris, gave private lectures on geology in Paris, and in 1869 was appointed professor of conchology at the Muséum d'Histoire Naturelle. From 1839 to 1842 he was a member of the scientific commission to Algeria. He was one of the founders of the Geological Society of France and frequently was elected its president. He assisted in the preparation of the statistical tables for Sir Charles Lyell's *Principles of Geology*, prepared the description of the recent and fossil mollusca obtained by the expedition to Morea, and began the compilation of a catalogue of the bivalve shells of the British Museum. It was as a student of fossil conchology that he was chiefly known. In this field he made important discoveries and wrote his most noteworthy work, the *Description des animaux sans vertèbres découverts dans le bassin de Paris* (1857-67), the result of more than 20 years of painstaking study. He also published a *Traité élémentaire de conchyliologie* (3 vols., 1834-58); *Mollusques de l'Algérie* (1848).

**DESHIMA**, dā'ehs'mā, or **DECIMA**, dā'sē-mā (Jap., Fore Island). A fan-shaped artificial islet connected by a single bridge with the city of Nagasaki (q.v.), Japan, on which the Dutch traders had their factory and residence from 1639 to 1859. Here the Dutch for 220 years enjoyed the European monopoly of trade with Japan, the recipients of honors as well as the subjects of rigid rule. In the renaissance of Japan Deshima played a most important part. Consult: Griffis, *Religions of Japan* (London, 1895); ib., *The Japanese Nation in Evolution* (New York, 1907); Rein, *Japan* (ib., 1884).

**DESHNEFF**, dēsh-nyēf'. The present official name of East Cape, the most northeasterly point in Asia, named after the Russian explorer Deshneff, who in 1648 discovered the strait named by Bering in 1728.

**DESHOULIÈRES**, dā'zōō'lyār', ANTOINETTE DU LIGIER DE LA GARDE (1638-94). A French poet, born in Paris. She was married very young (1651) to the Seigneur Deshoulières, a gentleman attached to the Prince of Condé, and for eight years was separated from her husband, he following the Prince into Flanders, where she rejoined him in 1657 and soon afterward was imprisoned for a year because of her obnoxious efforts to collect her husband's pension that was long overdue. After 1672 she lived in Paris, holding a kind of salon and gathering about her the poets, philosophers, and wits of the day. She was the head of the cabal against Racine's *Phèdre* (1677) and composed a cruel epigram

on the subject. Boileau, who never forgave her, has described her in his tenth satire. Her plays are weak, and her reputation rests upon several poems she wrote in the *Mercurie Galant* under the name of "Amaryllis" and was known by her flatterers as the "Tenth Muse." The best edition of her works was published in 1749.

**DESHT.** See DASHT.

**DESIC/CANTS** (for etymology, see **DESICCATION**). In medicine, the substances with astringent properties which are serviceable in checking secretion from a mucous membrane or causing scabbing over or cicatrization of an ulcer or wound.

**DESICCATION** (Lat. *de*, down from, away + *sicare*, to dry). The process of drying by the employment of heat, dry air, or chemical agents which have an affinity for water. Examples of the class of desiccants, or drying substances, are fused chloride of calcium, quicklime, caustic potash, fused carbonate of potash, sulphuric acid, and phosphorous pentoxide. Organic liquids are usually dried (i.e., freed of water) by introducing an appropriate desiccant into them: thus, alcohol is rendered absolute by allowing it to stand in contact with quicklime; benzene may be dried by letting it stand in contact with fused calcium chloride; etc. Solids, on the other hand, are dried, or kept dry, by leaving them within a desiccator or bell jar, in which the desiccant is contained in a separate vessel. A desiccator works most efficiently if a vacuum is established within it and if its desiccant is placed *above* the vessel containing the substance to be dried. See also **FOOD, PRESERVATION OF.**

**DESIDERIO DA SETTIGNANO**, dâ'sâ-dâ-rê-ô dâ sêt'tê-nyâ'nô (1428-64). One of the foremost Florentine sculptors of the early Renaissance. He was born at Settignano, near Florence, of a family of stonemasons, the son of Bartolommeo di Francesco. He is traditionally supposed to have been a pupil of Donatello, whose influence appears in the naive naturalism and the marble technique of his early works; but as the latter left Florence to remain 10 years in Padua in 1443 when his supposed pupil was only 15 years old, this influence must have been chiefly by example. Reminiscences of Luca della Robbia also occur in his earliest reliefs of the Madonna. Concerning his life only meagre details gleaned from public documents are known. He was received into the stonemasons' guild in 1453; in 1457 he lived near San Pietro Maggiore, Florence, and had a workshop with his elder brother near Ponte Trinità; took part in a competition for Siena in 1461, and died at Florence, Jan. 16, 1464. His masterpiece, the marble tomb of Carlo Marsuppini (church of Santa Croce), executed in 1455 or soon after, is probably the most beautiful Florentine grave monument of the fifteenth century. Within a frame surrounded by ornate carving of the most exquisite detail and elaborate invention the effigy of the dead man reclines upon his sarcophagus. A relief of the Madonna with two adoring angels is in the pediment, above which are the statues of two boys holding a garland, while below are two others with shields. Among his other works of large proportions was the celebrated ciborium of San Pietro Maggiore, unfortunately lost in 1784; others are the tabernacle of San Lorenzo, a magnificent marble chimney piece in South Kensington Museum, and a wooden statue of the

Magdalen in Santa Trinità. His works on a smaller scale include the delightful cherub frieze of the Pazzi Chapel, the relief of St. John in the Museo Nazionale, Florence, and a tondo of Christ and St. John the Baptist (Aronati collection, Paris)—all youthful works formerly ascribed to Donatello. Among his characteristic representations of the Madonna are the early reliefs in the Foulé collection, Paris, those in the Panchiattei Palace, Florence, and the Pinacoteca, Turin, and the terra-cotta statuette in South Kensington Museum. He carved also a number of naive and characteristic busts of children, such as the well-known "Laughing Child" of the Benda collection, Vienna; the same subject in the Dreyfuss collection, Paris; busts of boys in the Bibliothèque Nationale, Paris, the Dreyfuss collection, and in that of Sir Charles Robinson, London, and the fine "Head of a Youth" in the Museo Nazionale, Florence. Among his charming busts of young women are the well-known example in the Museo Nazionale, Florence, two others in the Berlin and the J. P. Morgan collections (Metropolitan Museum, New York) representing Marietta Strozzi; a sandstone bust and a painted plaster replica of a young woman thought to be a princess of Urbino, in the Berlin Museum. His other works include the spirited coat of arms with a lion rampant of the Gianfigliuzzi Palace, Florence; a relief supposedly of St. Cecilia in the collection of Lord Wemyss (London), usually attributed to Donatello; and a portrait of a supposed courtesan, South Kensington Museum.

Desiderio may be termed the leader of the charming group of marble sculptors who flourished in the generation following Donatello; he is the founder of their style, characterized by naive sincerity, refinement of treatment, and a certain meagreness of outline. In his decorative work he refined the architectural forms of the early Renaissance, invented many new motifs, and added greatly to the richness of detail. His sculpture is characterized by a masterly psychological interpretation, and his ideal types of the Madonna and child as well as young girls dominated sculpture for the rest of the century. Consult Bode, *Florentiner Bildhauer der Renaissance* (Berlin; Eng. trans., 1902), and *Die italienische Plastik* (ib., 1911). Nearly all of his works are reproduced in the monumental publication, Bode, *Denkmäler der Renaissance-Skulptur Toscanas*, plates 282-312 (Munich, 1892-1905).

**DESIDERIUS.** The last King (756-774 A.D.) of the Lombards (q.v.). After the death of Aistulf there was a contest for the kingdom, and Desiderius obtained it largely through the influence of the Pope, to whom he promised to return part of the Lombard conquests. After obtaining the kingdom, however, he only partially fulfilled his promise. For 14 years he was able to keep his territory almost intact. Through the marriage of his daughter, in 770, to Charles the Great, he seemed secure from any Frankish intervention; but after a year Charles repudiated his wife, and a little later Gerberga, the widow of Karlomann, fled to Desiderius with her children for protection against Charles. Desiderius hoped to have the children of Karlomann recognized as the lawful heirs to the Frankish Monarchy, and tried by an attack on the papal territory to force the Pope to anoint them. The Pope appealed to Charles, who in

773 crossed the Alps and in the following year succeeded in capturing Desiderius and conquering his kingdom. Desiderius was held as a prisoner in a monastery until his death. Consult: Hartmann, *Geschichte Italiens im Mittelalter*, vol. ii (Gotha, 1903); Hodgkin, *Italy and her Invaders*, vol. vii (Oxford, 1899); Abel-Simson, *Jahrbücher des frankischen Reiches unter Karl dem Grossen*, vol. i (Leipzig, 1888).

**DESIGN'** (OF, *dessein*, from Lat. *de*, out + *signare*, to mark). In the fine arts, the art of originating and combining elements of form or color to produce a unified composition. It requires in the designer a grasp of all the exigencies, both practical and aesthetic, of the problem he is to solve, combined with the necessary imagination to devise a scheme that shall satisfy these exigencies and at the same time form a beautiful and unified whole. A knowledge of art history is an advantage, though truly great design should be creative and scholarly, but not archaeological.

The solution of an artistic problem is also known as a design in a critical sense—as a good or bad design or as a design exhibiting certain qualities—but not otherwise. By an extension of this meaning the word "design" is loosely applied to those drawings, paintings, or models by which the artist expresses the conception he has originated; for these modes of expression are so closely bound up with the art they express as to be in the lay mind inseparable from them.

The word "design" is also used in analogous senses in the industrial arts, as in "textile design," "furniture design," etc.; and more loosely it is applied to any creative composition of many elements, even where the idea of beauty is totally lacking, as in "machine design," "aeroplane design," "bridge design," and analogous terms.

**DESIGN, SCHOOLS OF.** In ancient times every master of an art or artistic industry was accustomed to impart the secrets of his craft to a number of pupils, who in return gave him such help as they could, working upon his masterpieces and learning by practice, under his supervision, his particular methods as well as the established traditions of the craft. In the Middle Ages this system of teaching was highly developed by the guilds, which controlled all the arts and trades, particularly in Florence and north Italy, in Germany and Flanders, and to a considerable extent also in France and England. The governing councils of these guilds regulated the terms of apprenticeship and the course of instruction, prescribed the tests for promotion from one grade to another, and instituted prize competitions to stimulate proficiency.

The Italian Renaissance, however, brought about a return from corporate to individual teaching. The guilds lost their controlling influence because of the personal preëminence of great artists like Perugino, Raphael, Da Vinci, and Michelangelo. These attracted groups of apprentice artists, who became their ardent disciples and imitators, reproducing often for a while not only the general style, but even the tricks and mannerisms of their masters. The term "schools" applied to these personal or local coteries and groups (school of Raphael, Venetian school) does not designate organized institutions at all.

The teaching of design by systematic instruction in organized schools is a comparatively

modern idea. In the mediæval guilds, though the instruction was systematic in a measure, it was not given in schools or classes by specially appointed teachers. The first school of design to embody the new conception was the Royal Academy of Fine Arts, founded in 1648, in the reign of Louis XIV, in Paris. In this famous school, which has been in continuous operation ever since, five departments were established—those of painting, sculpture, architecture, engraving, and the cutting of gems and metals—in which instruction was given by regularly appointed professors, and proficiency encouraged by an elaborate system of awards, culminating in the Grand Prize of Rome in each department. See *ECOLE DES BEAUX-ARTS: PRIX DE ROME*.

In this school, to which France owes the training of many of her most illustrious artists, the first step was taken towards a scientific system of teaching design by analyzing the training required into its essential elements and teaching these separately by lectures and class work, with test examinations. Composition and the theory of design, the history of art, perspective, costume, and classical archaeology, and in architecture the orders and the elements of constructive science, are the chief divisions of this teaching. The actual studio work has, however, from the first been conducted largely on the traditional lines of the apprenticeship system; and this is true of most of the schools of design, both European and American. A few have, on the other hand, endeavored to carry the scientific organization of the instruction into their studio work, as in the teaching of decorative design in the South Kensington Schools (see *SOUTH KENSINGTON, NATIONAL ART SCHOOLS OF*) and like institutions in England, and in the American schools of architecture.

Since the middle of the nineteenth century the number of schools of design has greatly increased in Europe, and in the United States since 1876; in both cases this has been largely due to the stimulus of international exhibitions. Those of 1851 and 1862 in London, and in 1855 in Paris, opened the eyes of the English to the superiority of the French art industries and led to the establishment of the South Kensington Museum and Schools of Art and of scores of provincial schools for the training of skilled designers of textiles, ceramic wares, and other products of industry. Stimulated by the success of the British experiment, the various German states, the French government, and many municipalities in both these countries opened schools of design in the chief industrial centres. The marked feature of this movement, following the British precedent, was the recognition of the educational value of museums of industrial art.

In the United States the schools of design are, with but few exceptions, independent of municipal or State control, being managed by incorporated boards of trustees or influential art societies. Some of the museums of art are maintained or aided by the city or state; but in general both schools and museums have been founded by private munificence and are maintained without governmental aid. Besides the teaching in these special schools, drawing and elementary design are also taught in many public schools of Europe and America, as well as in evening classes conducted by the municipality or by philanthropic societies in the United States.

A broad distinction is generally made between schools of the fine arts, in which painting,

sculpture, and architecture are taught—sometimes also music and engraving—and schools of industrial art, which train their pupils for industrial design and the decorative arts. (See DECORATIVE ART.) In some cases the two kinds of training are offered in the same school, but this is rare. Architectural training, moreover, has in the United States been chiefly given in schools attached to universities or to technological institutions, and has been more thoroughly developed than any other branch of education in design in such schools as that of the Massachusetts Institute of Technology (1866), Cornell University (1889), Columbia University (1881), the University of Pennsylvania, and Harvard University.

In the modern schools of design free-hand drawing is universally recognized as the foundation upon which all the training must be based, since it involves the coordination of hand and eye. The grammar of design—i.e., the theoretic principles of good decoration and the rules which express these—is taught by lectures or textbooks and enforced by progressive exercises in design. Fertility and resource are cultivated by the study of the history of the decorative arts and of the examples of design in the museums, and the taste is trained both by this study and by the criticism of original designs prepared by the students. Finally, there is added to these branches the detailed technical instruction necessary for each particular industry, such as stained-glass work, carpet weaving, wall-paper making, pottery, and glasswork; and the graduate pupil is then qualified to enter the service of some industrial establishment or to make designs for sale to the manufacturers.

A number of the most important schools of design are treated in special articles, such as: ART STUDENTS' LEAGUE; BOSTON ART SCHOOL; ÉCOLE DES BEAUX-ARTS; NATIONAL ACADEMY OF DESIGN; ROYAL ACADEMY, LONDON; SOUTH KENSINGTON, NATIONAL ART SCHOOLS OF; SAINT LUKE, ACADEMY OF. Other important schools of design are: the École Nationale et Spéciale des Arts Décoratifs in Paris, the Berlin Bau-Akademie, the Vienna Imperial Art Institute, the School of Applied Design for Women, the Cooper Union (q.v.), New York, the Chicago Art Institute, and the textile schools of Lowell and Philadelphia. Consult: Münsterberg, *The Principles of Art Education* (New York, 1904); Ludwig, *Ueber Erziehung zur Kunstübung und zum Kunstgenuss* (Strassburg, 1907); Kunzfeld, *Unter den gegenwärtigen Stand der Kunsterziehungsfrage* (Langensalz, 1909); Adams, *Theory and Practice in Designing* (New York, 1911).

**DÉSIRADE**, dâ'zê'râd' (Sp. *desada*, desired). A small island of the French West Indies, situated about 8 miles northeast of Guadeloupe, of which it is a dependency (Map: West Indies, G 3). It is about 7 miles long and 1½ miles broad and contains about 10 square miles; it is without a good harbor. Its population (1906) was 1484, chiefly emancipated slaves. The island was the first discovery of Columbus on his second voyage in 1493. He named it Desada. It has been in the possession of the French since 1814. Pop., about 1500.

**DESIRE'** (OF. *desir*, Fr. *désir*, It. *desiro*, *desiderio*, from Lat. *desiderium*, desire, from *desiderare*, to desire). An imperfect volition. In both desire and volition an "attractive" object or "end" is set before consciousness; but in de-

sire the individual is unable to attain the "end," unable even to attempt to attain it, while in volition he makes an effort to possess the object. He can hardly say that he is "baffled" in desire, for that would imply the making of an attempt; and although the object appears as desirable, it does not appear as a thing to be sought after—at least, not for the moment. The inhibition is an integral part of the situation in which the desired object is presented. The central process in desire is, then, a motive shorn of its power. One may desire an object which has fallen out of reach; but since it is out of reach, one does not "will" to get it. Only when the means of attainment come before the mind, or, at least, when the impossibility of reaching the object escapes the mind, does the volition arise; only then, i.e., does one actually endeavor, strive to obtain the object. Until experience teaches that some things are impossible of attainment, the distinction between desire and volition does not arise. Thus, the infant desires the moon and at the same time stretches forth his hands to grasp it. He may still desire it after he has learned that it is an object in the sky, but he does not "will" to possess it.

Some psychologists have given the word "desire" a wider meaning than that just explained. They leave out the element of inhibition or inability and assert that whenever an idea presents itself as a motive it arouses desire, whether the thing desired, e.g., a dinner or an ideal in moral conduct, is or is not realized. Under the first definition desire is akin to wishing; under the second it is a particular kind of conation (q.v.), an appetition, or an "endeavor towards." It is probably better to restrict the term to its narrower meaning and to retain the element of inhibition, the lack of means by which the desire-consciousness might be changed into the volition-consciousness. Thus considered, a dissection of desire reveals a strong affective element, which may consist in pleasantness or unpleasantness. The thought of restriction is inherently unpleasant, but the unpleasantness may be overcome by the agreeable thought of the object. Over and above the affection and the ideas attended to, there is in desire a complex of organic sensations, and, in case the desire is sufficiently powerful—as in longing or yearning—a well-marked feeling of effort (q.v.). Consult: Bain, *Mental and Moral Science* (London, 1884); Wundt, *Human and Animal Psychology* (ib., 1901); Stout, *Manual of Psychology* (ib., 1890). See EMOTION; WILL.

**DESJARDINS**, dâ'zhâr'dân', ALPHONSE (1841-1912). A Canadian journalist and statesman. He was born at Terrebonne, P. Q., was educated at Masson College and Nicolet Seminary, and was admitted to the bar in 1862. For some years he practiced law, but in 1868 he abandoned it for journalism and served on the editorial staff of *L'Ordre* and as chief editor of *Le Nouveau Monde*. He took an active part in organizing the Canadian Papal Zouaves, sent to aid the Pope in 1868, and was one of the framers of the *Programme Catholique* (1871). For his services to the Roman Catholic church he was created a knight of the Order of Pius IX in 1872. In 1874 he was elected a Conservative member of the Dominion Parliament and retained his seat until 1892. He was mayor of Montreal (1893), Minister of Militia in Sir Mackenzie Bowell's administration in 1896, and in the same year was Minister of Public Works

in the administration of Sir Charles Tupper. Towards the end of 1896 he retired from political life.

**DESJARDINS, MARTIN** (1640-94). A French sculptor, whose real name was Martin van den Bogaert. He was born at Breda, in Holland, and studied under Verbruggen in Antwerp and later under Buiette in Paris, where he succeeded so well that he took up his residence there. He was made an academician in 1671, then professor (1681), rector of the Royal Academy (1686), and court sculptor to Louis XIV. His works are in several of the Paris churches, and at the Invalides and Versailles. His masterpiece was the colossal bronze statue of Louis XIV in the Place de la Victoire (1686), but this was destroyed in 1792, and there are only fragments of it left in the Louvre. It represented the King on foot, crowned by Victory. There are colossal statues of Louis XIV at Versailles and Lyons by Desjardins, and a fine bust of the painter Mignard, a bust of Edouard Colbert, and a statue of Hercules in the Louvre. His work is academic in finish, but has not much dramatic feeling.

**DESJARDINS, MICHEL ALBERT** (1838-97). A French writer and politician, born at Beauvais (Oise). He studied at the University of Paris and in 1871 was elected deputy for Oise in the National Assembly. From 1873 to 1875 he was Undersecretary in the Ministry of Public Instruction and in 1875-76 held the same post in the Ministry of the Interior. In 1877 he was appointed to the chair of legislation and criminal procedure in the University of Paris. He published *Le pouvoir civil au concile de Trente* (1869); *Traité du vol dans les principales législations de l'antiquité et spécialement dans le droit romain* (1881); *Code pénal russe* (1884); *Examen doctrinal: le droit criminel en Algérie et dans les colonies* (1887).

**DESMAN** (Sw. *desman* *råtta*, *desman*, from *desman*, musk + *råtta*, Ger. *Ratte*, rat). A large, aquatic, shrewlike mole of the genus *Myogale*, or *Galemys*, and family Talpidae, of which two species are known. They have completely webbed feet, the fore pair not adapted to digging and the hind pair enlarged into paddles, and a long and flexible proboscis. The best-known species is the Russian *desman* (*Myogale* [or *Galemys*] *moschata*), which inhabits the margins of streams and lakes throughout south-eastern Russia. It is about 16 inches long, including the tail, which is long and laterally compressed, forming a powerful swimming organ, acting as a sculling oar; and it is clothed in soft, mottled fur, blackish above and whitish beneath, and salable to furriers. An element of value in its fur is said to be the musky odor which clings to the fur, which is derived from a cluster of sebaceous anal glands and which renders the flesh uneatable. Its home is an extensive burrow in the bank of a stream, opening underneath the water, in which the *desman* spends most of its time, and where it searches, by means of its long, flexible, and sensitive nose, for insects, leeches, small mollusks, and similar food in the mud and beneath the stones. The other species (*Myogale pyrenaica*, or *Galemys pyrenaicus*) inhabits the Pyrenees, is far smaller, and has a perfectly round tail, but its habits are much the same. Fossils show that the *desman* inhabited Europe until the last Glacial era.

**DESMARETS DE SAINT-SORLIN**, dâ'-

mâ'-rà' de sâ'n sôr-lân', JEAN (1595-1676). A French dramatic and historical writer. He attracted the attention of Richelieu and through his influence became one of the founders, and the first chancellor, of the Académie Française (1634-38). Richelieu appointed him counselor to the King and Secretary General of the Levant marine. In 1645 Desmarets became a devout Catholic. This led him to attack the Jansenists of Port Royal, and the pen war lasted three years. The most interesting of his works is *De la comparaison de la langue et de la poésie française avec la grecque et la latine* (1670), which opened the long quarrel between the ancients and the moderns. His works also include *Les visionnaires* (1637), *Erigone* (1638), *Scipion* (1639). Consult H. Rigault, *Histoire de la querelle des anciens et des modernes* (1850).

**DESMARRES, dâ'mâr', LOUIS AUGUSTE** (1810-82). A French oculist, born at Evreux. In Paris, in 1839, he established the *clinique* which he conducted for 25 years. He introduced the operation of iridectomy. He also invented an ophthalmoscope and contributed to the *Gazette des Hôpitaux*. His principal publication is a *Traité théorique et pratique des maladies des yeux* (1854-58).

**DE SMET DE NAEYER, PAUL, COMTE**. See SMET DE NAEYER.

**DESMIDS**. One-celled algae that exhibit the greatest possible variety of form and are often extremely beautiful. The cell is peculiar in being organized into two symmetrical halves, often separated by a deep constriction which makes the "isthmus." In each half there is a large chloroplast, while in the isthmus connecting the two halves the single nucleus is placed. Many of the desmids have the power of locomotion, and they are very sensitive to light, taking a position determined by the incident rays. On account of the structure of the cell its division is peculiar. The nucleus divides, and a wall is formed across the isthmus. The division thus results in two new cells, each consisting of half of the old cell and a portion of the isthmus, which enlarges into a new half. In sexual reproduction the cells pair, the walls are ruptured at the isthmus, the protoplasts escape and fuse, and a fertilized egg (zygospore) is formed.

**DES MOINES, de moîn'** (Fr., of the monks). The capital and the largest city of Iowa, and the county seat of Polk County, near the geographical centre of the State, 138 miles east by north of Omaha, Neb., at the confluence of the Raccoon and the Des Moines rivers (Map: Iowa, D 3). It is an important manufacturing and commercial city and is noted for its extensive insurance interests and its exceptional railroad facilities, which include the lines of the Chicago, Rock Island, and Pacific, the Chicago, Burlington, and Quincy, the Chicago Great Western, the Chicago and Northwestern, the Wabash, the Minneapolis and St. Louis, the Fort Dodge, Des Moines, and Southern, and the Chicago, Milwaukee, and St. Paul, and also several interurban lines. Des Moines was settled in 1846, was incorporated as the town of Fort Des Moines in 1851, and in 1857 was chartered as a city and became the capital of the State, replacing Iowa City. It is built on gently sloping hills and contains, among its finest structures, the capitol, erected at a cost of \$3,000,000, the United States Government building, the State Historical building, city library, the county courthouse, two hospitals, a large auditorium, and

three public high schools. Des Moines is the seat of Des Moines College (Baptist), established in 1865; Drake University, founded in 1881 by the Disciples of Christ, but now non-sectarian; Highland Park College (Presbyterian), founded in 1890; Grand View College (Danish Lutheran), founded in 1895; and the Capital City Commercial College, founded in 1884. It has also an extensive system of parks and several bridges across the two rivers. The Iowa State Fair is held here annually. Des Moines and the surrounding region are underlaid with vast deposits of bituminous coal, a material advantage which has contributed to the city's rapid industrial growth. Among its manufactures are books and magazines, patent medicines, brick, trunks, carriages, wagons, sleighs, engines and boilers, cotton and woolen goods, pottery, Portland cement, glue, incubators, clothing, tile, sewer pipe, agricultural implements, confectionery, crackers, mattresses, harness, scales, furnaces, plows, soap, brooms, white bronze, gloves, twine, tents, linseed oil, wall paper, washing machines, furniture, axle grease, baking powder, electrical appliances, etc. The annual income and expenditures of the city amount to about \$2,200,000 and \$2,600,000 respectively, the principal items in the budget being \$75,000 for street lighting, \$80,000 for the fire department, and \$965,000 for schools. A city charter, embodying what has become known as the "Des Moines Plan" of municipal government, was adopted in 1907. It vests the government in a commission of five, chosen biennially, on a nonpartisan ticket, by the electors of the entire city, district divisions having been abolished. Other city officers are chosen by the commission, and city employees are selected by a civil-service board of three members appointed by the commission. Each of the administrative departments is controlled by a commission. The commissioners are subject to the recall on petition of 25 per cent of the registered number of voters. All franchises must be submitted to the people, and they can compel the commission to pass any law or ordinance. Fort Des Moines was established here in 1843 to protect the rights of the Sacs and the Foxes. Whites settled in 1851, and in 1900 the fort, with a full regiment of cavalry, was reestablished. Pop., 1890, 50,093; 1900, 62,139; 1910, 86,368; 1914 (U. S. est.), 96,691.

**DES MOINES COLLEGE.** An institution of higher education, situated at Des Moines, Iowa. It was established in 1865 by members of the Baptist church and was affiliated with Chicago University (see CHICAGO, UNIVERSITY OF) in 1892. The college offers the bachelor's degree in arts, science, and philosophy. It had in 1914 an enrollment of 507, including students in the musical and preparatory departments. The library contains 10,000 volumes. A special department for the training of teachers is maintained. Six college buildings stand on a wooded campus of 10 acres, including the athletic field. Buildings and grounds are valued at \$250,000. The endowment is \$200,000. The president in 1914 was John A. Earl, D.D.

**DES MOINES RIVER.** The most important river of Iowa. It is formed by the meeting of the east and west forks of the Des Moines in Humboldt Co., Iowa. The east fork is the outlet of Okamanpadu Lake, in Emmet Co., Iowa; the west fork flows from a chain of lakes, one of which is Lake Heron, in Jackson Co., Minn.

(Map: Iowa, D 3). The Des Moines flows southeasterly across Iowa and empties into the Mississippi River (q.v.) 3 miles below Keokuk. It is 550 miles long and drains an area of 14,500 square miles. From Farmington to its mouth it falls 48 feet, or 1½ feet per mile. The chief tributary is the Coon River, which joins it from the west at Des Moines. The chief cities along its banks are Ottumwa, Des Moines, and Fort Dodge. Through Lee County it flows in a narrow, gorge-like valley noted for its picturesque scenery.

**DES MOSPONG'LE.** See HEXACTINELLIDA.

**DESMOULINS**, dā'mōō'lān', LUCIE SIMPLICE CAMILLE BENOIT (1760-94). A French politician and journalist of the time of the Revolution. He was born at Guise, in Picardy, March 2, 1760, the eldest son of the lieutenant general of the Bailiwick of Guise. Through the influence of a relative young Desmoulin obtained a scholarship in the Lycée Louis-le-Grand, Paris, where he had Robespierre as a fellow student. After his graduation young Desmoulin studied law and became an advocate before the Parlement of Paris in 1785, but met with little success, owing, it is said, to a stammer in his speech. In 1788 he published a philosophical work, *La philosophie du peuple français*; but it was the dismissal of Necker, July 11, 1789, that first brought Desmoulin to the front as a Revolutionist. He heard the news on the evening of July 12 and, in the excitement of the moment forgetting his stammer, sprang on a café table in the garden of the Palais Royal and harangued the crowd of people around him. This scene marked the actual beginning of the Revolution. The cry "To arms!" resounded, and two days later the Bastille was taken. A Republican pamphlet, *La France libre*, which he brought out, was received with instantaneous favor, and he was encouraged to follow it up with a journal of a revolutionary nature. His *Discours de la lanterne aux Parisiens* was less to his credit and earned for him the nickname of "Procureur de la lanterne." Desmoulin was a hero worshiper, but inconsistent in his allegiance, and, after making Mirabeau his idol, transferred his affections to Danton, to whom he clung until the end. In 1791 both men were in danger of arrest for the extreme boldness of their views, but both escaped. It was at this time that Desmoulin ceased publishing *Les Révolutions de France et de Brabant*, his first journal, and began *La Tribune des Patriotes*, which became the organ of the Cordeliers. He was also intimate with Robespierre, who persuaded him to attack the Girondists in a work entitled *Fragment de l'histoire de la Révolution* (usually referred to as the *Histoire des Brissotins*). This venomous attack helped greatly in overthrowing the opposite party, but it is said that later Desmoulin regretted his course. With Danton he began to call for moderation, and towards the end of 1793 the first number of *Le Vieux Cordelier* appeared and stood up for just and legal trials and less severe sentences. Desmoulin attacked the Hébertists as well as the Committee of Public Safety, and the breach between the Dantonists and ultra-Jacobins grew wider. After being twice accused before the Jacobin Club, where he was defended by Robespierre, Desmoulin was at length arrested, along with Danton and others of the party. The merest formality of a trial took place, and they were all executed, April 5, 1794. Desmoulin

did not face death with the unflinching courage of Danton. His beautiful young wife, Lucile Duplessis, sought in every way to rescue him, but was herself arrested and guillotined a fortnight later. Consult: *Œuvres de Camille Desmoulins, avec une notice biographique*, ed. by Matton (Paris, 1838); Claretie, *Camille Desmoulins, Lucie Desmoulins, étude sur les Dantonistes* (ib., 1875); Eng. trans., *Camille Desmoulins and his Wife*, by Mrs. Cashel Hoey (London, 1876); Aulard, *Les orateurs de la Législature et de la Convention* (Paris, 1885-86); Lenotre, *Paris révolutionnaire* (ib., 1904).

**DESNA**, dā'snā. A river of Russia, rising in the Government of Smolensk, 72 miles southeast of the town of that name (Map: Russia, D 4). It flows southeast through the Government of Smolensk until it reaches Bryansk, in Orel, where it makes a sharp bend and, after a south-westerly course through the governments of Orel and Tchernigov, joins the Dnieper nearly opposite Kiev. The Desna is 690 miles in length and is navigable for steamers as far as Bryansk. Many important towns are found in its basin. The river thus acquires considerable importance in the inland trade of Russia.

**DESNOIRESTERRES**, dā'nwā'tār, GUSTAVE LE BRISQYS (1817-92). A French author, born at Bayeux. He is the author of a number of poems and novels, but his principal works have been historical studies of the eighteenth century. These include: *Voltaire et la société française au XVIIIème siècle* (8 vols., 1867-76), which was crowned by the Academy; *Les cours galantes* (1859-64); *La comédie satirique au XVIIIème siècle* (1884); *Le chevalier Dorat et les poètes légers du XVIIIème siècle* (1887).

**DESNOYERS**, dā'nwā'yā, AUGUSTE GASPARD LOUIS BOUCHER, BARON (1779-1857). A French engraver, born in Paris. He studied drawing with Lethieres, the dotted manner of engraving with Louis Darcis, and line engraving later under Tardieu. One of the most important engravers of his time, he became a member of the Institute in 1816, in 1825 was made engraver to the King, and three years later received the title of Baron. He is especially known for his engravings after Raphael, whose works he interpreted with peculiar sympathy and masterly technique. Among the best of his plates are Raphael's "La belle jardinière" (1801), Gérard's portrait of Napoleon (1808), the "Madonna della Casa d'Alba" (1827), the "Sistine Madonna" (1846), and especially "The Transfiguration" (1840). In 1821 he published a collection of 34 prints, entitled *Recueil d'estampes gravées d'après des peintures antiques italiennes*. His complete œuvre comprises 75 plates.

**DESNOYERS**, LOUIS CLAUDE JOSEPH FLORENCE (1805-68). A French author, born at Replonges (Ain). He contributed largely to the success of the *Journal des Enfants*, in which his *Mésaventures de Jean Paul Choppart* (1836, 1909) was published. This and the following story, *Aventures de Robert-Robert et de son ami Toussaint-Lavenette* (1840), are considered to be among the classics of the literature of education.

**DESOLATION ISLAND**. See KERQUELEN LAND.

**DESOLATION LAND**, also called **DESOLATION ISLAND**. An island of Chile, on the south side of the west end of the Strait of Magellan. It is 70 miles long and 15 miles broad. Its westernmost point is Cape Pillar.

**DE SOLA**, dē sō'lā, MELDOLA (1853- ). A Canadian Jewish rabbi and opponent of reformed Judaism. He was born in Montreal and was educated under the direction of his father, A. de Sola, also a Jewish rabbi. For a few years he was engaged in commercial pursuits, but after an experience in 1876-82 as voluntary lay assistant in the Spanish and Portuguese synagogue of which his father was rabbi, he succeeded the latter in 1882. His controlling aim was soon known to be uncompromising opposition to the Liberal movement in North American Judaism. He preached and worked against it vigorously. He was foremost in promoting, and was first vice president of, a conference of the representatives of orthodox Judaism (New York, 1898), and he was also one of the three rabbis who formulated the principles governing the convention. A result of the conference was the formation of the Union of Orthodox Jewish Congregations of the United States and Canada. He became a firm supporter of the Zionist movement (q.v.).

**DESOR**, dē-zōr', EDOUARD (1811-82). A Swiss geologist, born at Friedriehsdorf, near Homburg. He studied at the universities of Giessen and Heidelberg and in consequence of the part taken by him in political affairs was compelled to escape to Paris. Thence he went to Neuchâtel, where he became acquainted with Agassiz, whom in 1847 he accompanied to America. He subsequently became professor of geology in the Académie of Neuchâtel. He was elected a member of the Federal Grand Council and in 1873 became its president. His publications, dealing chiefly with the geology of Switzerland, include: *Gebirgsbau der Alpen* (1865); *Les palafittes du lac de Neuchâtel* (1865); *Echinologie helvétique* (1869-72); *Le paysage morainique* (1875).

**DE SOTO**. A city in Jefferson Co., Mo., 43 miles south by west of St. Louis, on the St. Louis, Iron Mountain, and Southern Railroad (Map: Missouri, F 3). It is in the centre of a lead and zinc mining region, exports grain, flour, produce, and live stock, and has a shoe factory, flouring and planing mills and railroad machine shops. The water works are owned by the city. Pop., 1900, 5611; 1910, 4721.

**DE SOTO**, HERNANDO (or FERNANDO). See SOTO, HERNANDO (or FERNANDO) DE.

**DESPAIR**, GIANT. The monstrous owner of "Doubting Castle," where Christian and Hopeful are temporarily imprisoned, in Bunyan's *Pilgrim's Progress*.

**DESPARD**, dēs'pārd, EDWARD MARCUS (1751-1803). An Irish conspirator, born in Queen's County. He entered the army as ensign in 1766 and in 1779 was appointed engineer in the San Juan expedition, in which he distinguished himself. In 1781 he became commander of the island of Rattan, with the rank of captain, and subsequently of the Bay of Honduras and the entire Mosquito Coast. Soon after the peninsula of Yucatan had been added to his domains by Spanish grant, he was accused of cruelty and other offenses by the prior English settlers, who resented the concessions made to logwood cutters from the Mosquito Coast. He was ordered to England, where he remained from 1790 to 1792, only to learn that there was no charge against him. An unjustifiable imprisonment from 1798 to 1800 so incensed him against the government that he devised a plot for the assassination of the King and the capture of

the Bank of England and the Tower. He was convicted of treason and executed at Newington.

**DESPENSER**, də-spən'sēr. A powerful English family of the thirteenth and fourteenth centuries.—**HUGH LE DESPENSER** (died 1265) was justiciar of England between 1260 and 1264 and was associated with Simon de Montfort in the rising against Henry III. He was killed at the battle of Evesham.—His son, **HUGH LE DESPENSER THE ELDER** (1262–1326), played a very prominent part in the reign of Edward II. He served in the Welsh Wars and in France and Scotland, being present at the battle of Dunbar in 1296. Subsequently he was employed on numerous diplomatic missions to various European Powers and to the Pope. Up to the year 1308 he was a member of the Barons' party, in which his property and rank assured him a high position, but about the time of the fall of Gaveston (q.v.), the King's favorite, he abandoned the cause of the Barons, and became the head of the Court party, and a bitter enemy of Thomas, Earl of Lancaster. Though undoubtedly avaricious and unscrupulous in the means he adopted for increasing his possessions, Hugh was probably no more selfish than most of the great nobles of his time, who took advantage of the presence of a weak king on the throne to further their own interests. In 1321 the Barons' party gained the upper hand, and Hugh was sentenced by Parliament to banishment. He was recalled, however, in the following year, when the King's faction was once more in the ascendant, and contributed no doubt to the fall and death of the Earl of Lancaster. In the same year he was made Earl of Winchester, and his position became more influential than ever. The feeling of hatred with which he was regarded by all the great nobles finally led to the outbreak of a rebellion, in which Isabella, the wife of Edward II, joined. The Queen's forces marched upon Bristol, which was defended by Hugh le Despenser. The King's favorite was forced to surrender and was speedily hanged.—**HUGH LE DESPENSER THE YOUNGER** (died 1326) was the son of the preceding. In his youth he was the intimate friend of the young Prince of Wales, afterward Edward III, and served with him in the Scottish wars. He obtained great wealth by his marriage to one of the heiresses of the house of Gloucester, and, like his father, was for a time a prominent leader among the Barons. It was not until 1318 that he went over to the King, being actuated in this move by an insatiable greed for land, which had brought him into repeated conflicts with many of the nobles of the Marches. A league was formed against him, headed by the Earl of Lancaster, and in 1321 he was banished with his father. With his father he was recalled in the following year, restored to his old possessions, and overwhelmed with grants and new titles. He met the same fate as the elder Hugh. In the Barons' rising of 1326 he was taken prisoner, brought to Hereford, tried upon the charge of piracy and complicity in the death of Thomas of Lancaster, and hanged. A grandson of Hugh the younger was the "warlike bishop," Henry of Norwich, who died in 1406. He was chosen by Urban VI to lead a crusade against the followers of Clement VII, the antipope, in Flanders. A great-grandson, Thomas (1373–1400), was created Earl of Gloucester. Consult: Tout, *Political History of England, 1216–1377* (London, 1905); Davis, *England under the Normans and Angevins* (ib.,

1905); Vickers, *History of England, 1272–1485* (ib., 1912); Wylie, *England under Henry IV* (4 vols., ib., 1884–98); Wrong, *Crusade of 1383, known as that of the Bishop of Norwich* (London and Oxford, 1892).

**DES PÉRIERS**, də p'ryā', BONAVENTURE (?1510–44). A French satirist and story-teller, born at Arnay-le-Duc. Arriving at Lyons in 1535, he worked in collaboration with Dolet (q.v.) on his *Commentaries on the Latin Language*. In 1536 he became the secretary of Margaret of Navarre, sister of Francis I, and took a prominent part in the literary quarrel between Marot and Sagon. Two years later appeared the work by which he is probably best known, the satiric *Cymbalum Mundi*, suggesting Lucian in its mockery of superstition, old and new, with an occasional pensive seriousness very characteristic of the finer culture of the French Renaissance. The work caused such a sensation among the clergy that the Parlement of Paris immediately ordered its suppression. Whether through fear of persecution which Margaret was powerless to avert or through insanity, Des Périers committed suicide in 1544. Besides translations and poems of minor interest, among which is a curious literary courtship of a nun, he left a collection of 129 *Nouvelles récréations et joyeux devis* (1558), written at different periods during his life and published by friends after his death. The best edition of Des Périers's works is that of Lacour (Paris, 1856). Frank published a separate edition of the *Cymbalum Mundi* in 1873. Consult: Chenevière, *Bonaventure Des Périers* (Paris, 1886); Frank and Chenevière, *Lexique de la langue de Bonaventure Des Périers* (ib., 1888); Rübner, *Syntaktische Studien zu Bonaventure Des Périers* (Leipzig, 1897).

**DES PLAINES** (də plān') **RIVER** (Fr., of the plains). A river rising near Racine, Wis. (Map: Illinois, D 2). It flows south nearly parallel with the shore of Lake Michigan, and from 6 to 12 miles distant, to Lyons, just west of Chicago, Ill., thence southwest, uniting with the Kankakee River (q.v.) in Grundy Co., Ill., and forming the Illinois River (q.v.). It is separated from the lake by a low divide, over which during high water it discharges into the Chicago River (q.v.). For 13 miles its waters have been deflected to form the Chicago Drainage Canal (q.v.). It is 150 miles long and drains an area of 1700 square miles.

**DESPOUTES**, də'pōrt', (ALEXANDRE) FRANÇOIS (1661–1743). A French animal and still-life painter, born at Champigneulle. He was the pupil of the animal painter Nicéasius, but was in the main self-taught. In 1695 he went for two years to Poland to paint portraits of the King, the royal family, and magnates of the court. On his return to France he devoted himself to painting animals and scenes of the chase and later to still life and fruit and flower pieces, and was employed by the King and the grandees of the French court. At the castle of Marly he painted portraits (now in the Louvre) of the most valuable dogs of Louis XIV, with whom he stood in high favor. He designed compositions for the Gobelins and Savonnerie tapestries. There are 27 pictures by him in the Louvre, and he is represented in many other European galleries. Although a very productive and facile painter, Desportes was always careful in his execution. His work compares favorably with that of the best Flemish masters in his line.

**DESPORTES, PHILIPPE** (1546-1606). A French poet, born at Chartres. In his youth he went to Italy as secretary to the Bishop of Puy and there studied the Italian poets, especially Petrarch and Ariosto, whom he imitated in his sonnets and elegies. On his return he rose rapidly in favor and enjoyed during his lifetime the reputation of a Ronsard. He was essentially a courtier; he praised the loves of the last Valois and became Abbé and Canon of the Sainte-Chapelle and court poet. His talent, neither original nor profound, is best shown in such charming verses as *Contre une nuit trop claire* and *Rosette pour un peu d'absence*, although certain of his religious poems have a sober beauty. Editions of his works appeared in 1573, 1583, and 1592. They were also published with an introduction by A. Michiels, as *Œuvres de Philippe Desportes* (1858). *Le mariage honni* (1573) was republished in 1908.

**DESPOT** (from Gk. *despôtēs*, *despotēs*, master, lord, ruler). An absolute ruler who carries on the government entirely in his own interests, pursuing generally a policy of cruelty and oppression. Like "tyrant," the word "despot" originally carried no odious meaning and denoted merely the possessor of unlimited power. In a modified sense, but still free from the imputations of tyranny, the title was applied to the rulers of the Greek towns of Asia Minor under the Persian domination and subsequently to the governors of the Asiatic provinces and towns of the Byzantine Empire.

**DESPRÈS, JOSQUIN**. See DEPRÈS, JOSQUIN.

**DESPRÈS, d'a'prè', SUZANNE ISABELLE** (1876- ). A French actress, born in Mexico. She studied at the Conservatoire in Paris and in 1897 won the first prize in comedy and the second in tragedy. She played at the Théâtre l'Œuvre and married its manager, Aurelien Lugné-Poë. She also appeared at the Antoine (in *Remplacantes*), the Porte Saint-Martin (in *L'Assommoir*), etc., and in 1902 made her début at the Comédie Française in *Phèdre*. In 1910 she played in *Elektra*. She was particularly successful in Ibsen's plays. She toured Germany in 1906 and appeared in London. Consult the appreciation by Sorel, *Nouvelle Revue*, pp. 25-34 (May, 1902).

**DESPRETZ, d'a'prá', CÉSAR MANSUÈTE** (1789-1863). A French physicist, born at Les-sines, Belgium. He was instructor of physical sciences at the Collège Henri IV in Paris and at the Polytechnic Institute and was appointed professor at the Sorbonne about 1837. His writings were published in the *Comptes Rendus* of the Paris Academy of Sciences, of which society he was a member, and in the *Annales de Chimie et de Physique* (1817-56). His *Traité élémentaire de physique* (1825; 4th ed., 1896) was adopted by the Council of Public Instruction. A product of carbon introduced by him is said to be almost as serviceable as diamond dust for polishing purposes.

**DESSAIX, d'a'sá', JOSEPH MARIE, COUNT** (1764-1834). A French general and politician, born at Thonons, in Savoy. In 1791-92 he raised volunteers for France in Savoy and was present at the siege of Toulon and subsequently served under Napoleon in Italy. He was a member of the Council of Five Hundred and was one of the few who opposed the coup d'état of the Eighteenth Brumaire. Nevertheless, he was made a brigadier general in 1803 and rose to be general of division by 1809. His conduct at

Wagram won him the title of "the Intrepid" from the lips of the Emperor. He was created a Count in 1810 and made Governor of Amsterdam. In the Russian campaign of 1812 Dessaix was severely wounded at Borodino. In 1814 he was successful against the Allies in Savoy. After the Revolution of 1830 he was appointed commander of the National Guards at Lyons. He died Oct. 26, 1834. For the details of his life, consult Dessaix et Folliet, *Étude historique sur la révolution et l'empire en Savoie: Le général Dessaix—sa vie politique et militaire* (Paris, 1879).

**DESSALINES, d'a'sá'lén', JEAN JACQUES** (1758-1806). A negro military leader, known as Jean Jacques I, Emperor of Haiti. He was born in Guinea, Africa (according to some accounts at Grand Rivière, Haiti), and was sold as a slave at Cap Français (now called Cape Haitien). In 1791 he entered the insurgent ranks under Biasson, and subsequently, with rank of lieutenant general, became one of the trusty subordinates of Toussaint l'Ouverture. For some time he maintained a guerrilla warfare against General Leclerc, the officer sent by Napoleon to subjugate the island, but, upon the conclusion of peace in 1802, he professed allegiance to the French, and was appointed Governor of the southern division of Haiti with rank of a general of division. Angered at the severe repressive measures of General Rochambeau, who succeeded General Leclerc, he organized and directed an uncompromising revolt, which, with the assistance of an English squadron, ended in the utter expulsion of the French. In 1804 he was appointed Governor General for life. But, infuriated by the failure of his expedition against the Spanish part of the island, he had himself crowned Emperor and proceeded to a cruel despotism. He was assassinated by two of his officers, Pétion and Christophe, the latter of whom became President of Haiti. Consult Dubroca, *Vie de J. J. Dessalines* (Paris, 1804).

**DESSAU, dés'sou** (first called *Disouwe*, then *Desso*). The capital of the German Duchy of Anhalt, on the Mulde, not far from its junction with the Elbe, 67 miles by rail southwest of Berlin (Map: Germany, E 3). The town lies in a well-wooded plain, surrounded by a very fertile and richly cultivated country. The streets are broad and well shaded. The palace, dating partly from the sixteenth century, contains a collection of paintings, including some excellent examples of the early Italian, Dutch, and Flemish schools. The palace is interesting also for its fine architectural features, its suite of Old German rooms, its relics of Prince Leopold (known as "the old Dessauer"), and Napoleon. Among the other buildings of note may be mentioned the old and new town halls, the new palaces of Princess Louise and the hereditary prince, the Parliament building, the new post office, and the theatre. The church of St. Mary, built in 1512 and restored in 1857, contains several pictures by the two Cranachs, and in the vaults the tomb of Prince Leopold, the sarcophagus being surrounded by the figures of six grenadiers. The town possesses all modern utilities. Its educational establishments include a gymnasium, several technical schools, and three large libraries, one maintained by the town. It has a number of art collections in two museums, and the Amalien Stiftung, founded by the daughter of Prince Leopold in the eighteenth

century. Dessau is the birthplace of the composer Friedrich Schneider, the poet Wilhelm Müller, and the philosopher Moses Mendelssohn, the two latter being commemorated by monuments. The bridge over the Elbe was the scene of the brilliant victory won during the Thirty Years' War by Wallenstein over Count Mansfeld on April 25, 1626. The city has grown very rapidly in the last 20 years. The refining of sugar is the principal industry, but manufactures of carpet, paper, cloth, machinery, railway cars, vehicles, and spirits have been greatly prospered. It is the centre of a fertile agricultural country, and by river it carries on a lively trade in grain. Pop., 1900, 50,846; 1910, 56,606. Dessau was founded in the twelfth century by Albert the Bear, received civic rights in 1213, and upon the division of Anhalt in 1603 became the residence of the Anhalt-Dessau line. It suffered severely during the Thirty Years' War, but began to recover its prosperity in the eighteenth century. Consult Würidg, *Chronik der Stadt Dessau* (Dessau, 1876).

**DESSOIR**, dā'swār', LUDWIG (properly LEOPOLD DESSAUER) (1810-74). A German actor, born in Posen. He was attached to the Leipzig Theatre from 1834 to 1836, that of Karlsruhe from 1839 to 1844, and the Hof-Theatre of Berlin from 1847 until his retirement in 1872. As an interpreter of tragic rôles from Goethe, Schiller, and Shakespeare, he took high rank. G. H. Lewes preferred his Othello to that of Kean.

**DE STAAL**, de stāl, M. G., BARON (1822-1907). A Russian diplomat, born in Esthonia and educated at the University of Moscow. In 1845 he entered the diplomatic service in the Asiatic department of the Ministry of Foreign Affairs, five years later becoming a member of the Russian embassy at Constantinople. Subsequently he served as consul general at Bucharest, on the staff of the legation at Athens (1859), and, beginning in 1864, again at Constantinople, as counselor to the embassy. There he obtained the Porte's permission for Russia to disregard the Black Sea clauses of the Treaty of Paris. From 1884 to 1902 he was Ambassador at the court of St. James's, and in this capacity he was instrumental in averting the threatened quarrel between England and Russia over the Afghan boundary. In 1899 he represented Russia at The Hague Peace Conference.

**DE STAEL**, de stāl. See STAEL-HOLSTEIN.

**DESTERRO**, dā-stār'ró. See FLORIANOPOLIS.

**DESTINN**, des'tin, EMMY (1878- ).

A Bohemian dramatic soprano, whose real name is Kittl. She was born in Prague, where she received her first musical instruction on the violin. When she discovered her musical voice, she studied with Madame Loewe-Destinn, who secured for her an engagement at the Berlin Royal Opera. Here her début as Santuzza in 1898 was so successful that she was permanently engaged for Berlin. Her European fame dates from her appearance as Senta in the first Bayreuth performance of *The Flying Dutchman* in 1901. In 1907 Strauss selected her to sing the title rôle in his *Salome* at the first Paris production. In 1908 she became a member of the Metropolitan Opera House of New York and one of the prime favorites. She is not only a great singer, but also a superb actress. Her repertoire includes 80 operas.

**DESTOUCHES**, dā'tōsh', PHILIPPE NÉRICAUULT (1680-1754). A French dramatist, born at Tours, Aug. 22, 1680. Of his 17 comedies,

*Le dissipateur* (1736) and *Le glorieux* (1732) are pronounced by Lessing "models of finer high comedy"; and the largely autobiographic *Le philosophe marié* (1727) is also a classic of the French stage. His works are commendable rather on account of the absence of great faults than from the presence of any real dramatic genius. Except in *La fausse Agnès* (1736), Destouches took his comic vocation too seriously, but he is important as a witness to the change in public feeling that was to welcome the "tearful comedy" (*comédie larmoyante*) of La Chaussée. Consult Al. Bûrner, *Destouches et ses comédies* (Albe-Royale, 1906).

**DESTROYING ANGELS**, or DANITES. See DANITES.

**DESTRUC'TOR**, REFUSE. See GARBAGE.

**DESTUTT DE TRACY**, dā'stut' de trā'sé', ANTOINE LOUIS CLAUDE, COUNT (1754-1836). A French philosopher. At the outbreak of the Revolution he was a colonel in the army and was sent to the States-General as a delegate of the nobility of Bourbonnais. In 1792 he accompanied his friend Lafayette into exile, but returned secretly to France not long afterward and was cast into prison, from which only the downfall of Robespierre released him. Under Napoleon he was a senator, and after the Restoration was created a peer by Louis XVIII. As a philosopher, he represented the doctrine of sensualism, following more especially Condillac, whose system he further developed to the so-called ideologism. His principal work is *Éléments d'idéologie* (1801-15). His other works include: *Grammaire générale* (1803); *Commentaire sur l'esprit des lois de Montesquieu* (1806; Eng. trans., 1811); *Traité de la volonté* (1815).

**DE TABLEY**, LORD. See WARREN, JOHN BYRNE LICESTER.

**DETACHMENT** (Fr. *détachement*, from *détacher*, to detach, from *dé*, away + *tacher*, to fasten, from It. *tacca*, tack, from Bret. *tach*, Ir. *taca*, Gael. *tacaid*, mail), MILITARY. "A body of troops separated from a higher command and intrusted with a special mission. Nearly every command of any size is composed of troops from the different arms or special services, or both, and when not constituting a division, brigade, or other authorized unit, the question arises whether to call such a command a *détachment* or to give it the tactical designation of the predominating arm or special service; if there is a predominating element, the title of the command is that of the predominating element, unless the proportion of an auxiliary arm or special service equals or exceeds that prescribed for a division, in which case the command is a *détachment*. For example: a command consisting of one regiment of infantry and one squadron is a *détachment*, while the title of a command consisting of one regiment of infantry and a troop is that of the regiment." (*Field Service Regulations*, U. S. Army, 1913.)

**DETAILLE**, de-tā'y, JEAN BAPTISTE EDOUARD (1848-1912). A French military painter. He was born in Paris, Oct. 5, 1848. A pupil of Meissonier, his early pictures evince the same devotion to detail and finish that marks the works of his master; but he developed a broader style with better atmospheric treatment. His "Repose during Drill in Camp Saint-Maur" (1869), painted when he was 21 years old, secured him his first medal. In 1870 he took up arms for his country, but he was never unmindful of his art and made sketches whenever he

could. It was in sketching scenes incident to camp life that he perfected his technique and made himself competent to reproduce vividly and correctly the movements of troops in preparation for battle or resting after a fight. The horrors of war he suggests rather than depicts, and his treatment may be observed in his "Salute to the Wounded" (1877). His "Movement of Troops" and "The Dream" (Luxembourg Museum), are well-known canvases. His "Passing Regiment" (1875), which is familiar by its reproductions, is the property of the Corcoran Gallery in Washington. The Metropolitan Museum of Art, New York, possesses three of his works, including the "Defense of Campigny," called by the artist his best work, and the Vanderbilt collection, on loan in the Metropolitan Museum, New York, has a like number. In collaboration with De Neuville he painted two panoramas of the campaigns of 1870-71, exhibited in Paris in 1882-83. Among his latest works are decorative paintings in the Hôtel de Ville, Paris (1902-04) and the Panthéon (1905); the "Rue du Petit Pont" (1910), an episode of the Revolution of 1830; and "General Lassalle at Wagram" (1912). He was made a chevalier of the Legion of Honor for his "Retreat." Consult: Claretie, *L'Art et les artistes français contemporains* (2d series, Paris, 1876); Goetschy, *Les jeunes peintres militaires* (ib., 1878); Valmy-Baysse, *Peintres d'aujourd'hui* (ib., 1910); and monographs by Carel (ib., 1882) and Vachon (ib., 1897).

**DETAINER** (from Lat. *detinere*, from *de*, off + *tenere*, to hold). The technical term of the common law for a withholding of the possession of property. The gist of the act is not the manner in which the adverse possession was acquired—this may have been lawful or unlawful—but the continued detention of the property from one who claims the right to the possession thereof. No question of title or ownership is necessarily involved in the notion of a detainer, as one who is not the owner may nevertheless be entitled to the possession of the property, and, on the other hand, the owner may be guilty of an unlawful detainer of his own land or goods. A detainer is always an act of force and may be lawful or unlawful. The appropriate remedy where goods are unlawfully detained is *detinue*, or *replevin*, and if, after demand made, the holder refuses to return them, he is deemed to have converted them to his own use and becomes liable to an action in trover for damages. An unlawful detainer of lands gives rise to a right of entry or, in modern practice, to an action of ejectment. Trespass is not available if the original entry was rightful, nor can any action be employed whose purpose is to try the question of title, as that is not involved. When a detainer follows upon a wrongful entry, it may, nevertheless, be valid, as when one, in violation of law, forcibly recovers possession of his land from an intruder. Here the illegal entry is punishable, but in some jurisdictions the subsequent possession of the owner of the land will not be disturbed. See **CONVERSION**; **DETINUE**; **FORCIBLE ENTRY**.

**DÉTAMPES**, dâ'tâmp', DUCHESSE. See ESTAMPES, ANNE DE PISSELEU, DUCHESSE D'.

**DETECTIVE** (from Lat. *detectus*, from *de-tegere*, expose, from *de-neg* + *tegere*, to cover). One who engages in the work of securing evidence respecting persons suspected of wrongdoing for the purpose of having it used for or against

them in civil or criminal proceedings. He may be a public officer or a private employee. In many cities there are extensive detective bureaus, whose members are in no way connected with the official police or constabulary establishments. Some states forbid persons to act as detectives without a license from a court or other official source. A detective does not become an accomplice of a criminal even when his knowledge of the criminal's plans would have enabled him to prevent the commission of the crime. His act in entrapping a criminal, if limited to mere entrapment, does not render him liable to punishment, nor does it in any way excuse or exonerate the criminal.

**DETERMINANTS** (Lat. *determinans*, pres. part. of *determinare*, from *de-* + *terminare*, to bound, limit). Certain algebraic functions remarkable for their brevity of notation and their wealth of significant properties.  $\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} \Sigma = a_1b_2$ , or  $(a_1b_2)$  are merely other notations for  $a_1b_2 - a_2b_1$ . The first form is commonly used in elementary mathematics. Similarly

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$$

represents  $a_1b_2c_3 + a_2b_3c_1 + a_3b_1c_2 - a_2b_1c_3 - a_3b_2c_1 - a_1b_3c_2$ . Such functions are called determinants, and the quantities  $a_1, b_1, c_1, a_2, b_2, c_2, \dots$  are called elements. The first or square form of notation is called the array notation. If there are more columns than rows, the form is called a *matrix*. An array of two columns and two rows is called a determinant of the second order, one of three columns and three rows a determinant of the third order, and so on. In the expansion of a determinant of the second order there are two terms, each containing the letters  $a, b$ , but differing in the arrangement of the subscripts, 1, 2. In the expansion of a determinant of the third order there are six terms, each containing the letters  $a, b, c$ , but differing in the arrangement of the subscripts 1, 2, 3. Thus, there are two terms in the expansion of a determinant of the second order, and six in one of the third order, half of which are positive and half negative. The signs are selected according to the arrangement of the subscripts. If there is an even number of inversions in the order of the subscripts of any term, its sign is considered plus; if an odd number, its sign is considered minus; e.g., in the term  $a_1b_2c_3$ , 3 standing before 2 is an inversion, since the natural order is 2 before 3; likewise 3 before 1 and 2 before 1 are inversions; there being three inversions, the sign is minus. A determinant of the fourth order contains 16 elements, and its expansion contains 24 terms. In general, a determinant of the  $n$ th order contains  $n^2$  elements, and its expansion  $n(n-1)(n-2) \dots 2 \cdot 1$ , or  $n!$  terms. Some of the leading properties of determinants are: 1. If two adjacent columns or rows of a determinant are interchanged, the sign only of the determinant is changed; if a column or row is transposed over an odd number of columns or rows, the sign only of the determinant is changed; if a column or row is transposed over an even number of columns or rows, the determinant is unchanged. 2. If the columns are made rows, and conversely, the determinant is unchanged. 3. If the elements of a row or column are added to the corresponding elements of another column or row, the value of

the determinant is unchanged. 4. Multiplying the elements of any column or row by a number multiplies the determinant by that number. 5. If two columns or two rows are identical, or if the elements of any row or column are all zeros, the determinant vanishes. Such properties are of great aid in evaluating determinants.

Various methods of expansion have been devised by which the terms, each containing one element and only one, from each column and each row, can readily and systematically be formed. While these methods can best be obtained from a textbook on the subject, minor determinants will be explained here, since they furnish a simple means for expanding determinants of degrees higher than the third. If the column and row to which any element belongs are suppressed, the resulting determinant is called a first minor of the given determinant, or the cofactor of the given element. If two rows and two columns are suppressed, the resulting determinant is called a second minor of the given determinant, and so on. Thus, in

$$\Delta = \begin{vmatrix} a_1 & b_1 & c_1 & d_1 \\ a_2 & b_2 & c_2 & d_2 \\ a_3 & b_3 & c_3 & d_3 \\ a_4 & b_4 & c_4 & d_4 \end{vmatrix}$$

$(b_2c_4d_1)$  is a first minor of  $\Delta$  and a cofactor of the leading element  $a_1$ , and  $(a_1b_2)$  is a second minor of  $\Delta$ .

If the cofactors of  $a_1, b_1, c_1, d_1$  are denoted by  $A_1, B_1, C_1, D_1$ , then it can be shown that  $\Delta = a_1A_1 + b_1B_1 + c_1C_1 + d_1D_1$ . It should be observed that  $A_1, B_1, \dots$  involve their own signs, and that in the above equation  $B_1$  and  $D_1$  are negative. Thus, a determinant of the  $n$ th order may be expanded in terms of determinants of the  $(n-1)$ th order, and so on. Determinants also admit, in their abridged form of notation, of the fundamental operations of addition, subtraction, and multiplication (including involution).

These functions are of great importance in the solution of simultaneous equations. The roots in the case of two linear equations,  $a_1x + b_1y = c_1$  and  $a_2x + b_2y = c_2$ , are expressed thus:

$x = \frac{(c_1b_2)}{(a_1b_2)}, y = \frac{(a_1c_2)}{(a_1b_2)}$ . In the case of three equations involving three unknowns, of the type  $a_1x + b_1y + c_1z = d_1, a_2x + b_2y + c_2z = d_2, a_3x + b_3y + c_3z = d_3$ , the roots are

$$x = \frac{(d_1b_2c_3)}{(a_1b_2c_3)}, y = \frac{(a_1d_2c_3)}{(a_1b_2c_3)}, z = \frac{(a_1b_2d_3)}{(a_1b_2c_3)}.$$

In the case of  $n$  linear equations involving  $n$  unknowns,

$$x = \frac{(k_1b_2c_3 \dots k_n)}{(a_1b_2c_3 \dots k_n)}.$$

For  $n$  homogeneous linear equations, the determinant notation serves to express the necessary and sufficient condition for the consistency of the system. Thus, in the system  $a_1x + b_1y + c_1z = 0, a_2x + b_2y + c_2z = 0$ , and  $a_3x + b_3y + c_3z = 0$ , if  $(a_1b_2c_3) = 0$ , the equations can be satisfied by a set of values of  $x, y, z$ . This determinant of the coefficients is called the *discriminant* or the *eliminant* of the system of equations. It is the expression which results from eliminating the unknowns from the given equations. The discriminants of higher equations also may be expressed in determinant form. Thus, the eliminant of two equations, one of the  $m$ th and the other of the  $n$ th degree,

may be found by a method known as Sylvester's *dialytic process*; e.g., to form the eliminant of  $px^2 + qx + r = 0$  and  $ax^2 + bx^2 + cx + d = 0$ , multiply the members of the first equation by  $x$  and  $x^2$ , and the second by  $x$ , and form a system of five equations considering  $x^2, x, 1$ , and  $x$  as the unknowns. The eliminant is

$$\begin{vmatrix} 0 & 0 & p & q & r \\ 0 & a & b & c & d \\ a & b & c & d & 0 \\ 0 & p & q & r & 0 \\ p & q & r & 0 & 0 \end{vmatrix} = 0.$$

If  $u, v, w$  are functions of  $x, y, z$ , the determinant

$$\left( \frac{du}{dx}, \frac{dv}{dy}, \frac{dw}{dz} \right) \equiv \frac{d(u, v, w)}{d(x, y, z)} \equiv J(uvw)$$

is called the Jacobian of the system  $u, v, w$ , with respect to  $x, y, z$ . In the particular case where  $u, v, w$  are the partial differential coefficients (see CALCULUS) of the same function of the variables  $x, y, z$ , it is called the Hessian of the primitive function. These and other expressions play an important part in expressing the properties of certain curves (q.v.) and surfaces; e.g., it is shown in modern geometry that if the first polar of any point  $A$ , with respect to a curve  $u = 0$ , homogeneous in  $x, y, z$ , has a double point  $B$ , the polar conic of  $B$  has a double point  $A$ . The locus of the double point  $B$  is expressed by the Hessian

$$\begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix} = 0$$

which is satisfied by  $x, y, z$ , and in which  $a, b, c, \dots$  are differential coefficients of the second order. This function is also an example of a covariant. See FORMS.

The first idea of determinants has generally been attributed to Leibnitz (1693). There is no doubt, however, that Seki Kowa (1642-1708), the Newton of Japan, knew of these functions some years before the idea occurred to Leibnitz. Seki treats of them in his *fukudai* problems as early as 1683 and evidently knew of them even before this date. Leibnitz merely asserted that the condition for the simultaneous nature of the equations  $10 + 11x + 12y = 0, 20 + 21x + 22y = 0, 30 + 31x + 32y = 0$ , is that the expression  $10 \cdot 21 \cdot 32 - 10 \cdot 22 \cdot 31 - 11 \cdot 20 \cdot 32 + 11 \cdot 22 \cdot 30 + 12 \cdot 20 \cdot 31 - 12 \cdot 21 \cdot 30$  shall vanish. Seki, however, treats of  $n$  equations; he knew that the number of terms in the expansion of a determinant of the  $n$ th order is  $n!$ ; and he knew the law of interchange of rows and columns. Following the work of Leibnitz, but entirely ignorant of that of Seki, Cramer (1750) added somewhat to the theory, treating the subjects wholly in relation to sets of equations. The recurrent law was first announced by Bézout (1764). But it was Vandermonde (1771) who first recognized determinants as independent functions, giving a connected exposition of the theory, and hence he deserves to be called its formal founder. Laplace (1772) gave the general method of expanding a determinant in terms of its complementary minors. Immediately following, Lagrange (1773) treated determinants of the second and third orders, being the first to apply these functions to questions foreign to eliminations, and he discovered many special properties. Gauss (1801) introduced the name "determinants," although not in

its present sense; he also arrived at the notion of reciprocal determinants and came very near the multiplication theorem afterward given by Binet (1811-12) and Cauchy. With the latter (1812) the theory of determinants begins in its generality. The next great contributor, and the greatest save Cauchy, was Jacobi (from 1827). With him the word "determinant" received its final acceptance. He early used the functional determinant already mentioned, and which Sylvester has called the Jacobian, and in his famous memoirs, in Crelle for 1841, he specially treats this subject, as well as that class of alternating functions known as alternants. But about the time of Jacobi's closing memoirs, Sylvester (1839) and Cayley (qq.v.) began their great work, a work which it is impossible to summarize briefly, but which represents the development of the subject to the present time. The study of special forms of determinants has been the natural result of the completion of the general theory. Axi-symmetric determinants have been studied by Lebesgue, Hesse, and Sylvester; per-symmetric determinants by Hankel; circulants by Catalan, Spottiswoode, Glaisher, and Scott; skew determinants and Pfaffians, in connection with the theory of orthogonal transformation, by Cayley; continuants by Sylvester; Wronskians by Christoffel and Frobenius; Jacobians and Hessians by Sylvester; and symmetric gauche determinants by Trudi. The theory as a whole has been most systematically treated by F. Brioschi (1824-97), well known as the editor of the *Annali di Matematica*, whose masterly treatise on determinants is a standard (French and German translations, 1856. Consult also his *Opere matematiche*, Milan, 1901- ). **DETERMINATE PROBLEM.** In algebra or geometry, a problem of a limited number of solutions; e.g., given the base, perimeter, and area of a triangle to construct it. In this problem there are, in general, four solutions. But if any one of the three elements is omitted, the problem becomes indeterminate. The equation  $2x + 3y = 12$  can be satisfied by an indefinite number of values of  $x$  and  $y$ ; hence it is indeterminate, but the equation  $3x^2 - 12 = 0$  has only two roots, 2, -2; hence it is determinate. See DIOPHANTINE ANALYSIS.

**DETERMINING TENDENCY.** A term used in experimental psychology to explain the continuity of thought or action. Hobbes, in the *Leviathan*, distinguishes between mental discourse that is unguided, without design and inconstant, and mental discourse that is regulated by some desire or design. The first of these kinds of discourse is evidently realized in dreams and reverie. The phenomena here involved are explained by reference to associative tendencies. (See ASSOCIATION OF IDEAS;

DISPOSITION.) The second mode of discourse, in which ideas seem to be regulated or guided, as happens when we are thinking out a problem, was supposed by Hobbes to be governed by the continued presence of some persistent idea; an emotion, e.g., would be especially effective because it would make a deep impression, would therefore frequently recur, and would thereby prevent the mind from wandering. Bain goes further and asserts the necessity of an habitual attitude, of an emotion, occupation, or pursuit, which not only determines some one out of many possible trains of ideas, but also "combines itself with every casual impetus given to the mental trains so as to constitute an element of the composite effect." Furthermore, he suggests the need of a "positive stimulus, a second starting point, to individualize and determine the bent of the suggesting power to one or other of many associated ideas." Thus, because of an habitual attitude, a naked circle is rich in associations to the geometer, but it does not follow that "every circle shall hurry the mind of the geometer all through the Third Book of Euclid." The associative links in this case are good and sound, but "some one of the properties of the circle is resuscitated by preference," and this arousal determines the bent, or affords a second starting point of the particular train.

Bain has here a complete mechanism for the explanation of a regulated course of ideas, though, as it stands, it cannot meet the requirements of our current psychology. In the first place, his "ideas" are logical, not psychological in character; and secondly, the presence of a persistent idea that holds throughout the course of a train of thought is not discoverable under experimental conditions. It is found that the idea which is present as a starting point soon drops out of consciousness, though not before the meaning of the idea has aroused a tendency, known as the "determining tendency," which directs the course of subsequent ideas. The nature of the determining tendency can, perhaps, be best explained by reference to experiments. The idea, the meaning of which arouses the determining tendency, is known in the psychology of action as the idea of end; in the psychology of thought, as the instruction or problem. When an observer comes for the first time to an experiment, he is *instructed* what to do (idea of end), or when and what to observe (instruction). The instruction sets up a determining tendency, which facilitates the appearance of ideas in accordance with the experimenter's meaning and blocks all others. The determining tendency is not always, however, immediately effective; if, for example, the observer has been instructed to react or to observe upon the appearance of a signal, the determining tendency set up by the instruction is, as it were, held in abeyance until it is touched off or released by the signal. Moreover, it frequently happens, when the experiment has been many times repeated, that the instruction is not consciously remembered; yet, on the appearance of the signal, the observer continues to act in accordance with the original instruction.

It is easy to find examples of these phenomena in everyday life; any purpose, aim or ambition, intention or resolution, may set up a determining tendency, and any opportunity, command, or suggestion may serve as a "signal" to touch-off the determination. Here, too, the

original purpose with its idea of end may be entirely forgotten, but the opportunities and suggestions are nevertheless accepted as if the original idea were continually present in consciousness. There is, however, one exception to this statement. If two determining tendencies interfere, the stronger of the two will modify the weaker; an example of such interference is given under Abstraction (q.v.).

The determining tendency is physiological in nature; it is unconscious in its operation, though the determination itself may be represented in consciousness; and it must be both inhibitory and facilitative in character. The nature of the underlying physiological processes is, of course, hypothetical; we can only suppose that they are nervous coordinations and integrations, in part common to the race and transmitted from one generation to another, in part acquired in the individual lifetime, either by way of habit or under stress of some salient experience. See ACTION; DISPOSITION; DISCRIMINATION.

Consult: Hobbes, *Works*, vol. iii (London, 1839); Bain, *The Senses and the Intellect* (ib., 1894); Ach, *Ueber d. Willensstatigkeit u. d. Denken* (Göttingen, 1905); Titchener, *Experimental Psychology of the Thought Processes* (New York, 1909); *Text-Book of Psychology* (ib., 1910).

**DETERMINISM.** The name given to the view that every event in time, psychic as well as physical, has a cause (see CAUSALITY), and that, the cause being given, the event follows unvaryingly. It is opposed to indifference or indeterminism, which maintains that, at least in the phenomena of the human will, the temporal antecedents do not definitively determine the event. These opposing doctrines have their main interest in the sphere of ethics, as determinism is generally assumed to be true of all events except volition. The frankest of indeterminists, Prof. W. James (q.v.), admits that his doctrine is an advocacy of chance, pure and simple. The determination of will by motives has until recently been questioned, mainly because it was thought to carry with it a denial of moral responsibility. But this has been stoutly denied by many determinists with a good show of reason. Of late, however, indeterminists such as Bergson (q.v.) have based their views not so much on ethical as on experimental grounds. Bergson maintains that the very nature of time as experienced precludes the deterministic hypothesis. The argument may be stated briefly as follows: We never experience anything twice in exactly the same way. The memory of the former experience always modifies the second experience. Hence there can be no such thing as exact repetition; and where there is no repetition there can be no determinism, for determinism presupposes that the same antecedent upon repetition is always followed by the same consequent. Other opponents of determinism base their objections upon considerations derived from biology. Driesch is perhaps the best-known representative of biological indeterminists. The whole question of determinism is much more debatable now than it was two decades ago. See ETHICS; CHANCE; FREE WILL; WILL; MECHANISM; FINALISM; and consult the authorities referred to under ETHICS; also James, *The Will to Believe* (New York, 1897); Fouillée, *La liberté et le déterminisme* (2d ed., Paris, 1883); Ward,

*Naturalism and Agnosticism* (New York, 1899); Bergson, *Time and Free Will* (London, 1910); Driesch, *Science and Philosophy of the Organism* (ib., 1907-08); Palmer, *Problem of Freedom* (Boston, 1911).

**DETINUE** (OF. *detinu*, from Lat. *detinere*, from *de*, back + *tenere*, to hold). A common-law action for the recovery of specific chattels, wrongfully detained from the claimant, or their value, together with damages for their detention. It is immaterial whether the defendant came into possession of the chattels lawfully or unlawfully, so long as he has no present right to retain them as against the claimant. Thus, if the defendant held goods as a gratuitous bailee, his possession would be lawful until a demand was made by the proper party for their return; but in case of refusal to do so, the claimant might maintain *detinue*, as the detention would then be unlawful. Demand before suit is not necessary if the original taking was wrongful. The plaintiff need not be the owner of the detained chattel in order to maintain the action. It is sufficient if he has such an interest in the property as to have a right to its immediate possession. A judgment in *detinue* was formerly enforced by a special form of execution, called a writ of *distringas* (q.v.). This has been abolished in England, but is retained in several of the United States. See COMMON FORMS; COMMON LAW; PLEADING; REPLEVIN; TROVER.

**DETMOLD**, dēt'mōlt (OHG. *Theotmalli*, *Thiatmalli*, people's court). The capital of the German Principality of Lippe and residence of the Prince, situated on the Werre, at the eastern edge of the Teutoburg Forest, about 47 miles southwest of Hanover (Map: Germany, C 3). It consists of an old and a new town, the latter of which is well built, and adorned with many fine public walks and gardens. The chief buildings are the old and new palaces, the former of the sixteenth century, the Rathaus, and theatre. Its educational institutions include a gymnasium, a manual training school, a deaf and dumb school, and a library of 120,000 volumes. The industries include the manufacture of buttons, labels, tobacco, cloth, linen, leather, furniture, and beer. Marble and gypsum are quarried. Pop., 1900, 11,971; 1905, 13,157; 1910, 14,295. The sturdy "Senner" race of horses is bred near Detmold. The Externsteine, a much visited group of five rocks, with a grotto and a relief of the Descent from the Cross, are in the vicinity. About 2 miles to the southwest of the town, on the Grotenburg, one of the highest points of the Teutoburg Forest, stands the colossal Hermanns-Denkmal, or Arminius Monument, erected in honor of the famous Cheruscan Prince who gained here a signal victory over the Roman general Varus in the year 9 A.D. The poet Ferdinand Freiligrath was born here in 1810. Detmold was also the scene of a victory of Charlemagne over the Saxons in 783. In 1011 it was presented by King Henry II to the bishops of Paderborn, and from them it came to the Lippe family. It received civic rights in 1350.

**DE TREVILLE**, de trā'vil', YVONNE (1881- ). An American prima donna, born at Galveston, Tex. She studied under Madame Marchesi at Paris, and made her début when only 16 years old, in New York, at that time creating the principal part in *La Bohème*. Thereafter she sang entirely abroad, in *Lakmé*

at the Opéra Comique, Paris, at the Stockholm Royal Opera and the St. Petersburg Symphony Concerts (1903-04), the Cairo Khedivial Opera, and the St. Petersburg Imperial Opera (1904-05), and from then until 1909 in Bucharest, Berlin, Budapest, Nice, Brussels, Vienna, Munich, and Cologne. In 1910-11 she made operatic and concert tours in Austria, Hungary, Germany, Poland, Rumania, and Russia.

**DETROITUS** (Lat., a rubbing away, from *deterere*, to rub away, from *de*, down + *terere*, to rub). A general geological term applied to fragmental accumulations formed by the disintegration of rocks. See **EROSION**.

**DE TROBRIAND**, (PHILIPPE) REGIS (DE KEREDERN). See **TROBRIAND**.

**DETROIT**, *dé-troit'*. The chief city of Michigan, a port of entry, and the county seat of Wayne County, on the Detroit River, 18 miles from Lake Erie. It extends 11 miles along the border of the Detroit River and the shores of Lake St. Clair and is in lat. 42° 19' N. and long. 82° 58' W., 85 miles east-southeast of Lansing, 285 miles east by north of Chicago, and 251 miles west by south of Buffalo (Map: Michigan, F 6). The altitude of Detroit is about 600 feet; mean annual temperature, 48.4° F.—January, 24.6°; July, 72°; average annual rainfall, 36.19 inches.

The river, sometimes called "The Dardanelles of the New World," which is here the boundary between the United States and Canada, is ½ mile wide and 30 to 50 feet deep. It affords a splendid harbor, with a water front of about 11 miles. Fort Wayne, with its extensive works, commands the channel. Ferries connect with the Canadian side. The river contains many beautiful islands, which, with those in Lake St. Clair, are popular as places of summer residence and as resorts. Grosse Isle is the largest of these river islands, and Belle Isle has been converted into the city's finest park.

The city has an area of 41.76 square miles and is finely situated on ground rising gradually from the river. It has a reputation for broad, clean, well shaded and paved streets. Of a total of about 650 miles of thoroughfares, more than one-half is paved, the principal streets being laid with brick or asphalt. Most of the streets cross at right angles, but these are intersected by several broad avenues, radiating from the Grand Circus, a semicircular park of 5½ acres in the heart of the city. Woodward Avenue extends through this and divides the city into nearly equal portions. This intersection of streets and avenues has resulted in a number of small triangular parks, some of which contain handsome fountains. Woodward Avenue, the principal business street and at its northern end the centre of a fine residence district, is the location of many of the city's most prominent buildings. The Campus Martius, a considerable plot of ground about ½ mile from the river, is a part of Woodward Avenue. Jefferson Avenue, in part also an important business centre, and West Fort Street contain costly dwellings. Michigan, Gratiot, and Lafayette avenues have many notable buildings. Fine residences are on the Grand Boulevard, on Cass Avenue, and on the streets in the northern section of the city, Virginia Park, Boston and Chicago boulevards, and Arden Park. The banking houses are in Griswold Street. Grand Boulevard, 150 to 200 feet wide and paved with macadam, has its head

at Jefferson Avenue, and its terminus on the opposite side of the city. It surrounds the heart of the city, being about 12 miles long, and is a magnificent thoroughfare.

The street railway system of Detroit operates 533 miles of track, including the interurban systems to Mount Clement, Port Huron, Flint, Pontiac, Ypsilanti, Ann Arbor, Jackson, Trenton, and Toledo.

**Buildings.** The Wayne County courthouse is the largest and one of the most attractive of the public edifices. The City Hall, facing the Campus Martius, is 200 feet long by nearly 100 feet wide, built of sandstone, at an original cost of \$600,000. On the campus is the Soldiers' and Sailors' Monument, by Randolph Rogers, 55 feet high, and surmounted by a representation of "Michigan." The Majestic, Ford, Dime Bank, Free Press, Hammond, and Penobscot buildings, near the City Hall, are Detroit's finest office buildings. The Post Office, Masonic Temple, Federal building, Chamber of Commerce, Board of Commerce, Detroit Athletic Clubhouse, Y. M. C. A. building, Harper, General, and Grace hospitals, and the Hotel Pontchartrain are notable. Among the finest ecclesiastical structures are First Unitarian, First Congregational, First Presbyterian, First Street Presbyterian, North Woodward Avenue Congregational, Second Church of Christ (Scientist), Sacred Heart of Mary (Roman Catholic), Woodward Avenue Baptist, Woodward Avenue Presbyterian, St. John's (Protestant Episcopal), and Christ Episcopal churches, St. Paul's Cathedral (Episcopal), and Temple Beth El. The Museum of Art has a library, and valuable collections on art, archaeology, science, local and general history. Its special features are the Stearns collection of Oriental curios, one of the finest in America, and the Scripps collection of old masters, which includes valuable specimens of famous artists.

**Parks.** The most notable feature of the public-park system, which includes over 1200 acres, is the island park, Belle Isle, of 707 acres. It lies opposite the eastern section of the city, with which it is connected by an iron bridge, erected in 1889 at a cost of \$315,000. The island with improvements has cost the city \$9,000,000. The beauty of its river location is supplemented by a series of interior lakes and canals, which extend around the island, while a further improvement is projected in the reclamation of the shoal at the western end of the island, which will add at least 100 acres to its territory. On this projection will be erected the Scott Fountain, for which the late James Scott gave his entire fortune of nearly \$500,000. Palmer Park (141 acres), on Woodward Avenue, 6 miles north of the City Hall, contains a famous log cabin and other historical relics and a large Colonial casino. It was acquired by gift in 1894 from the late Senator Thomas W. Palmer and his wife Elizabeth Merrill Palmer. The total park and boulevard area is 1243 acres.

There are several cemeteries in the city, the most notable of which are Elmwood (Protestant) and Mount Elliott (Roman Catholic), both in the eastern section of the city, of great natural beauty and containing handsome monuments. Just without the city are several large new cemeteries, notably Woodlawn, Evergreen, and Grand Lawn.

**Institutions.** Detroit has, besides numerous

public and parochial schools and private secondary institutions of learning, a normal school (city), Detroit University (Jesuit, opened in 1877 under the name of Detroit College), the Detroit College of Law, the Michigan College of Medicine, which maintains schools of dentistry and pharmacy. The Detroit Bar Library has over 10,000 volumes, and there are several educational and institutional libraries. The public library, founded in 1865, contains 278,100 volumes in the central library and has established nine branches, besides one in each of the six high schools.

The city has a poor fund, administered by a Poor Commission. There are about 30 private charities. The Detroit Association of Charities is a general organization, representing a number of allied institutions. The House of Correction, which has a plant valued approximately at \$500,000, with accommodations for 600 inmates, has a wide reputation as a reformatory institution. Besides the United States Marine Hospital, there are five large general hospitals, including Grace, Harper, and General hospitals, in connection with which are training schools for nurses. There is also the Herman Kiefer Hospital for contagious diseases. Other institutions are St. Mary's and Red Cross hospitals, Home for the Friendless, St. Vincent's Orphan Asylum, Protestant Orphan Asylum, Arnold Home for the Aged and Hospital for Incurables, Thompson Home for Old Ladies, Florence Crittenton Home, Deaconess's Home, and Home for the Aged Poor.

**Commerce and Industry.** There are a number of conditions which favor Detroit as a commercial and industrial centre. Its position in the southeastern part of the Lower Michigan Peninsula gives it a natural command over the trade of that region and at the same time places it within easy reach of the country to the south; while its location upon the narrow strait leading from Lake Erie to Lake St. Clair and thence to Lake Huron brings it into relation with the immense lake traffic and with the Canadian trade, a number of the railroads of the Dominion naturally making their connection with those of the United States at this point. A new tunnel under the Detroit River, built for the Michigan Central Railroad, has greatly increased the volume of trade between Detroit and Canada and expedited travel between New York and the West.

Detroit ranks first among the northern border ports in the extent of its foreign trade and is first in the amount of its exports. For the year ending June 30, 1913, the imports amounted to \$9,158,669, and the exports \$62,222,404. About three-fourths of the total trade is with Canada and the larger part of the remainder with England. The principal exports are hog products, including hams, bacon and lard, manufactures of iron and steel, cotton, corn, lumber, and coal. The number of vessels in foreign trade entering the port in the fiscal year ending June 30, 1912, was 2232, with an aggregate tonnage of 662,356; the vessels clearing, 2172, with a total of 644,795 tons. The river is open to navigation about eight months in the year.

The manufactures are noted for their variety as well as their extent. Among the leading products are automobiles, stoves, freight cars, adding machines, alkaline products, drugs, varnish, paint, and oils, some of the establishments that produce these articles ranking among the

largest in the world. Detroit has also extensive drydocks and shipbuilding plants and the largest seed house in the world. At one time the city was a leading lumber market of the country, and the sawing and planing mill industry was extensive; all this has declined considerably, but there are a number of allied industries, such as the manufacture of furniture and carriages, which have attained importance. The preparation of furs for market is of less importance than formerly. Detroit, being midway between the coal mines of Pennsylvania and Ohio and the iron and copper mines of Michigan, is the logical point for the manufacture of the iron, copper, and brass products. These industries have grown rapidly in recent years, as has also the manufacture of aluminum. The manufacture of pharmaceutical preparations and of malt liquors, and the slaughtering industry, though of recent development, have attained considerable dimensions. Other important manufactures are those of chewing and smoking tobacco, cigars and cigarettes, and clothing. The recent industrial growth of the city has been noteworthy; in the period between 1904 and 1909 the number of manufacturing establishments increased from 1362 to 2036. The capital invested in the various industries in 1909 was \$190,125,000, the value of the product \$252,992,000, and the value added by manufacture \$122,775,000.

**Government.** The government is vested in a mayor and a unicameral council, elected biennially. There are a number of administrative boards and commissions, most of which, with other important municipal officials, are appointed by the Common Council on nomination of the executive. The Board of Health is appointed by the State governor. Commissioners of public works, parks and boulevards, and police are appointed by the mayor. The city clerk, treasurer, justice of the peace, police justices, and members of the Board of Education, who serve for four years, are chosen by popular vote. There is also a Board of Estimates, constituted of two representatives from each ward and five members from the city at large, with certain ex-officio members, which acts upon the general city estimates and all other measures for raising money. The United States District Court for Eastern Michigan sits at Detroit, and the United States Internal Revenue office and the department in charge of the lake light-houses, are located here.

**Finance.** The net debt of the city on July 1, 1913, was \$7,866,221, the per capita debt being exceptionally low. The legal borrowing limit is fixed at 4 per cent of the assessed valuation. The city tax budget for 1913 was \$10,127,183, and in addition there was derived from licenses and franchises \$225,000 and from special taxes (used to pay salaries of school teachers), \$900,000. The school budget for the year was \$4,801,389.85. The city owns and operates its light plant and water works. For the fiscal year ending June 30, 1914, the Public Lighting Commission was allowed \$674,276.67, of which \$239,942.78 was for operation and the balance for extensions. The water-works system comprises some 876.5 miles of mains, with the pumping station situated at the southeasterly part of the city. The supply is taken from the Detroit River. The plant, which was valued in 1913 approximately at \$12,000,000, has a daily capacity of 184,662,480 gallons.

DETROIT

THE POST OFFICE (UPPER)  
WAYNE COUNTY COURT HOUSE (LOWER)

**Population.** Detroit was in 1910 the third largest of the Great Lake cities and ranked ninth among those of the United States. The following figures indicate its growth: 1820, 1422; 1860, 45,619; 1880, 116,340; 1890, 205,876; 1900, 285,704; 1904, 317,591; 1910, 465,766. Of the last, 156,565 were foreign born, the German and Canadian elements being the largest. About two-thirds of the native born were native white of foreign parents. The colored population numbered only 5741.

**History.** The site of Detroit was visited by Frenchmen as early as 1648 and again by La Salle in 1670, but no permanent settlement was made until 1701, when Sieur de la Mothe Cadillac, the first Commandant of the French territory in this vicinity, built here Fort Pontchartrain and established a small trading village. On Nov. 20, 1760, an English force, under Major Robert Rogers of "Rogers Rangers," took possession, and in 1763, from May 9 to October 12, the Indians under Pontiac besieged the village, making frequent attacks. After an heroic defense Detroit was saved, being the only frontier post west of Niagara and Fort Pitt which was not captured. In 1778, when a new fort, Fort Lernout, was built, the place had only about 300 inhabitants, all of whom lived in rude log cabins. Throughout the Revolution it was the headquarters of the English forces in the Northwest and the point from which many Indian expeditions were sent to ravage the frontiers. In 1796 the English abandoned the fort to the Americans. The name of the fort was subsequently changed to Fort Shelby. After this the settlement grew slowly and in 1802 was incorporated as a town by the Legislature of the Northwest Territory. In 1805 it was almost completely destroyed by fire. All the buildings within the palisade, except one dwelling, were reduced to ashes. The town was immediately replanted on a larger scale with wide streets, and the rebuilding was begun at once. On Aug. 16, 1812, the fort was surrendered by General Hull to the English under General Brock. The Americans reoccupied the place Sept. 29, 1813. In 1815 Detroit was incorporated as a village, and in 1824 was chartered as a city by the Legislative Council of Michigan Territory. It was the capital of the Territory from 1805 to 1837 and of the State from 1837 to 1847, when the seat of government was removed to Lansing.

Consult: Farmer, *The History of Detroit and Michigan* (Detroit, 1889); Burton, *Cadillac's Village: A History of the Settlement, 1701-1710* (ib., 1896), and *The Building of Detroit* (1912); chapters in Parkman, *A Half Century of Conflict* (Boston, 1892), and *The Conspiracy of Pontiac* (ib., 1867); various papers in the *Michigan Pioneer Collections* (Lansing, 1874-1913); Farmer, "Detroit," in *Historic Towns of the Western States* (New York, 1901).

**DETROIT.** A city and the county seat of Becker Co., Minn., 194 miles by rail northwest of Minneapolis, on Detroit Lake and on the Northern Pacific and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: Minnesota, B 3). It is in a picturesque lake region with mineral springs and good hunting and fishing. The city contains a Carnegie library and owns its electric-light and power plant. Agriculture is the principal industry, and there are manufactures of cement products. Pop., 1900, 2060; 1910, 2807.

VOL. VI.—47

**DETROIT RIVER.** A river or strait connecting Lakes St. Clair and Erie, flowing nearly west to Detroit and then south, and separating Michigan from Ontario, Canada. It is so called from the French word meaning "strait." It enters Lake Erie just eastward of Pointe Mouillée and is about 28 miles long, from  $\frac{1}{4}$  to 3 miles wide, of considerable depth, swift in current, and admits the largest vessels. Its upper section between Fighting Island and Lake St. Clair is unobstructed, while its lower section from Detroit River Light to the same island is divided into several channels by a number of islands. It is the great waterway, with the St. Clair Lake and River, from Lakes Superior, Michigan, and Huron to Lake Erie. More tonnage of shipping is estimated to pass through this river than through any other stream in the world. There are many islands along its course, and the scenery is very beautiful. See DETROIT.

**DETROYAT**, də'trōw'yā', PIERRE LÉONCE (1829-98). A French naval officer, journalist, and author, born at Bayonne (Basses-Pyrénées). He studied at the Ecole Navale, took part in the Crimean War and in the subsequent expedition to China, and accompanied to Mexico the Archduke Maximilian, of whose ill-fated Empire he was appointed Undersecretary of State for Naval Affairs and chief of the military cabinet. He accompanied the ill-fated Princess Charlotte on her return to Europe. During the Franco-Prussian War he was for a time in command of the camp at La Rochelle. From 1860 to 1869 he was a member of the staff of *La Liberté*, which he edited from 1869 to 1876. He subsequently founded *Le Bon Sens* and *Le National*, the latter a conservative and Bonapartist journal, and in 1885-86 he edited the *Constitutionnel*. His works include the following: *La cour de Rome et l'empereur Maximilien* (1867); *L'intervention française au Mexique* (1868); *Du recrutement, de l'organisation et de l'instruction de l'armée française* (1871); *Le sénat et le scrutin de liste* (1881); *Nos possessions françaises en Indo-Chine* (1887); *Les chemins de fer en Amérique* (1886).

**DETTINGEN**, dət'ting-en (Teut., the people's home, from OHG. *diot*, *diota*, MHG. *diel*, Goth. *þiuda*, AS. *þeod*, people + *ingen*, the patronymic suffix). A village in Bavaria (Lower Franconia), on the right bank of the Main. It is noted as the scene of a battle during the War of the Austrian Succession, June 27, 1743. George II of England headed the armies of the Allies. Cooped up in a narrow valley, 37,000 English, Hanoverian, and Hessian troops lay, surrounded by 60,000 French on the heights. Noailles's cannon swept the flank and rear of the Allies, and the only exit from the valley, the defile of Dettingen, was held by young De Grammont with 25,000 men. Impatiently charging upon the Allies, he was thrown back with slaughter and confusion. The French loss amounted to 6000 men; that of the Allies to 2000.

**DEUCALION** (Gk. Δευκαλίων). According to the Greek myth, a son of Prometheus, grandson of Iapetus, and husband of Pyrrha. The crimes of the race of men then living led Zeus to destroy them in a great flood, but Deucalion, warned by his father, saved himself and his wife in a chest (κάραξ), which floated for nine days on the waters and then grounded on Mount Othrys in Thessaly. Later versions made

Deucalion land on Mount Parnassus, or on Athos, or even on Etna. Deucalion and Pyrrha now offered up sacrifices to Zeus and asked how the human race could be renewed. Bidden to throw the "bones of their mother" over their shoulders, they sought to obey by throwing stones; the stones thrown by Deucalion became men, those thrown by Pyrrha women. Deucalion's grave was shown at Athens, where he was said to have founded the temple of Olympian Zeus. Through his son Hellen (q.v.) he became the ancestor of the Greeks. Consult Ovid, *Metamorphoses*, i, 243-415, and Usener, *Die Sintflutsagen* (Bonn, 1899).

**DEUCHER**, doik'er, ADOLF (1831-1912). A Swiss statesman. He was born at Steckborn, Canton of Thurgau, and studied medicine at Heidelberg, Zurich, Prague, and Vienna. In 1855 he became a member of the council of his canton, and in 1868 he served as a member of the council established to formulate a new democratic constitution for Thurgau. From 1869 to 1873 he was a member of the National Council of Switzerland, and three years after his reelection to that body became its President (1882). In 1883 he became a member of the Federal Council, and in 1885 its Vice President; and in 1886 was elected President of the Swiss Confederacy, serving until 1887. He was reelected to that office in 1897 and 1903.

**DEUNTZER**, doint'ser, JOHAN HENRIK (1845- ). A Danish jurist and statesman, born in Copenhagen. He fought in the War of 1864 against Germany, became professor of Civil Law at the University of Copenhagen in 1872, and in 1901, when the system of ministerial responsibility to Parliament was established, became head of the first Liberal ministry. He resigned in 1905 owing to differences in his cabinet. He wrote extensively on Danish law in all its branches.

**DEUSDE'DIT**, or ADEODATUS. Pope from 615 to 618. He is honored as a saint on November 8.

**DEUS EX MACHINA**, mak't-nā (Lat., God from a machine, a translation of Gk. θεὸς ἀπὸ μηχανῆς, *Theos apo mēchanēs*). An expression borrowed from the ancient classical theatre. The tragic poets often employed the intervention of a divinity to solve abruptly a tragic difficulty and to bring about quickly the dénouement. The god was brought on by stage machinery; hence the name. Examples of the use of this device are the appearance of Heracles in the *Philoctetes* of Sophocles and of Athena in the *Iphigenia in Tauris* of Euripides. From the ancient usage the term has been extended to mean any device by which a dramatic situation is abruptly solved. On the *mechane* or *machina* in general, as used in the Greek theatre, consult Haigh, *The Attic Theatre*, pp. 200-217 (3d ed., Oxford, 1907).

**DEUS-RAMOS**, dā'ooash rā'mōsh, João DE (1830-96). A Portuguese poet, born March 8, 1830, at San Bartholomeu de Messines, in the Province of Algarve, and educated in law at the University of Coimbra, although he left in 1859 without taking his degree. In 1862 he left Coimbra for Beja, where he had been appointed editor of *O Bejense*, the most influential newspaper in the Province of Alentejo. In 1866 he edited the *Folha do Sul*. At the request of friends he entered politics, and was elected Liberal deputy from Silves in 1869. But he felt it necessary to act independently of all parties and consequently resigned, although he knew

such action would kill all chance for future advancement. For several years thereafter he devoted himself to educational problems, throwing himself heart and soul into an attempt to improve the educational condition in Portugal. This was highly important work, and he did it extremely well. But many critics are inclined to the belief that the country paid too high a price for it, since he was naturally forced thereby to limit the output of his exquisite lyrics. In this field, even as things stand, João de Deus is now considered as having no equal in his generation and, saving only Camões and Garrett, no equal in the literary history of his country; and prophecy concerning his repute with posterity is especially favorable with regard to his poems of love. He has been called "the foremost poet of love, not only in Portugal, but in Europe." And this repute is his despite his incredible carelessness about public opinion, for he seldom kept copies of his poems (contenting himself generally with dictating them to his friends) and was not responsible for a single edition of his works; these were collected by friends and admirers, who were not always well informed as to what poems were, and what were not, from his pen. A great popular and scholastic festival in his honor was held on his sixtieth birthday. He died at Lisbon, Jan. 11, 1896, was granted a public funeral, and was buried in the National Pantheon, the Jeronymite Church at Belem. Consult: João de Deus, *Campo de flores. Poemas lyricos completos* (2d ed. by Theophilo Braga, Lisbon, 1896); Maxime Formont, *Le mouvement poétique contemporain en Portugal* (Lyons, 1892); Marco Antonio Canini, *Libro dell'amore*.

**DEUSSEN**, dois'sen, PAUL (1845- ). A German philosopher and Sanskrit scholar, born in Oberdreis. He studied at the universities of Bonn, Tübingen, and Berlin, in 1889 was appointed professor of philosophy at Kiel, and in 1907 was made a member of the governing council of that university. His philosophy combines the systems of Kant, Schopenhauer, and the Indian sages. His works include *Commentatio de Platonis Sophista, Compositione et Doctrina* (Bonn, 1869); *Das System des Vedānta* (ib., 1883); *Der kategorische Imperativ* (Kiel, 1891); *Erinnerungen an Friedrich Nietzsche* (Leipzig, 1901); *Allgemeine Geschichte der Philosophie mit besonderer Berücksichtigung der Religionen* vols. i, ii (ib., 1894-1913); *Die Elemente der Metaphysik* (2d ed., 1890; Eng. trans. by Duff, London, 1894); *Philosophy of the Upanishads*, Eng. trans. by Geden (Edinburgh, 1906); *Outlines of Indian Philosophy* (Berlin, 1907); *Jakob Bohme: über sein Leben und seine Philosophie* (1911); *The System of the Vedānta According to Bādarāyana's Brahma-sūtras and Cankara's Commentary thereon*, trans. by Charles Johnston (Chicago, 1912).

**DEUS VULT** (God wills it). The rallying cry of the First Crusade, originating in the exclamation of the multitude after the completion of Pope Urban II's address at the Council of Clermont, 1095.

**DEUTEROCANONICAL BOOKS**. A designation of certain books which are recognized as canonical by the Roman Catholic church and the Oriental churches, rejected by the Protestant churches generally as apocryphal, and at present withdrawn from public use and treated as apocryphal by the Greek Orthodox church in Russia, Servia, and Bulgaria, and regarded as

of doubtful authority in Greece. They are Judith, Tobit, Baruch, 1 and 2 Maccabees, Ecclesiasticus, and Wisdom of Solomon; some parts of Daniel and Esther in the longer recension preserved in the Greek Bible are likewise deutero-canonical. All these works are found in the great codices of the Old Testament in Greek and in the versions made from the Greek text, and are referred to by early Christian writers in such a manner as to leave room for no doubt that they formed a part of the Scriptures which the first Greek-speaking converts to Christianity received from the Hellenistic Jews. But they were not included in the collection of books that, in the judgment of the Aramaic-speaking Jews of Palestine, possessed such a sanctity that it was necessary to wash one's hands after contact with them. Some of them, like 2 Maccabees, Wisdom of Solomon, and the Additions to Esther, were written originally in Greek and could not therefore have been considered at all in reference to this ceremony by the Palestinian rabbis. Among those that were composed in Hebrew or Aramaic some, like Baruch and Ecclesiasticus, are likely to have been thought of in this respect inasmuch as, even long after the decision, they were occasionally read and quoted as Scripture. How far this was true of the rest cannot be determined. It may be said, however, that, unless these books in the original had enjoyed a great prestige in Palestine, they would probably not have been translated into Greek and been cherished with the other biblical books by the Alexandrian Jews. As to the reasons why they were not included in the Palestinian canon, if they actually had for several generations been held in high repute and read for purposes of edification, the attitude of Josephus and the author of 4 Esdras, our earliest witnesses to the reduction of the collection to 22 or 24 books, seems to show that one consideration that had much weight was age, and that no work was included which was supposed to be later than Ezra's time. But the prevalent opinion among the Jews of Alexandria made no such distinction. They knew from the preface to Ecclesiasticus that this book could not have been written before the second century B.C. and no doubt inferred as much in regard to Esther from the preface to this book. There is no evidence that they immediately followed the example of the Palestinian rabbis in reducing their canon, or collection of religious classics, to a fixed number. On the contrary, the quotation of Enoch i-xxxvi and the Assumption of Moses, by New Testament writers, and the introduction into their Bibles by various churches in early Christendom of many Jewish works clearly translated from the Greek (see APOCRYPHA), seem to indicate either that the canon of the Alexandrian Jews never was absolutely fixed or that, in addition to a canon which was itself more inclusive than the Palestinian, there was a group of antilegomena recognized by some and rejected by others. The Old Latin and Saïdic versions made from the Greek towards the end of the second century A.D. contained the deutero-canonical group, but not many, if any at all, of the antilegomena. Origen, who would not limit himself to the Hebrew canon, seems to recognize certain boundaries set for the larger canon; and Athanasius, Rufinus, and Jerome, who would not recognize as canonical any books not in the Hebrew canon, enumerates the deutero-canonical books as a special group cherished by the

Church; though the great Greek codices are not quite consistent, and Sinaiticus contains 4 Maccabees, Alexandrinus 3 and 4 Maccabees, and both 3 Esdras, they make no distinction between proto- and deutero-canonical books and, like most of the later versions, do not contain such works as the Psalter of Solomon, the Testaments of the XII Patriarchs, Jubilees, the Assumption of Moses, and the Apocalypses of Enoch and Baruch; and the councils of Hippo (393 A.D.) and those of Carthage (397 and 419) accepted the same deutero-canonical group as among the books received by the fathers to be read in the church and to be held as canonical. From these considerations it would seem extremely probable that, as a rule, the Hellenistic Jews in the second half of the second century A.D. recognized the deutero-canonical books as part of their canon, though some may have adopted the narrower canon of the Aramaic-speaking Jews of Palestine, and others no doubt counted as Scriptures quite a number of additional books. This would account for the dominant view among the early Christian fathers, and also for the disappearance in most cases of the Greek translations of the apocrypha, or pseudepigraphal books, as they are often called by Protestant writers.

There is no means of determining how extensive Philo's canon was. In his discussions with the Jew Trypho, Justin would naturally quote no book that was not recognized by him; and Melito of Sardes reports the Jewish canon he found in Palestine. Origen called the attention of the Church to the differences between its text and its canon and those of the synagogue. Athanasius, Cyril of Jerusalem, Rufinus, Jerome, Epiphanius, Gregory of Nazianzus, Ambrosiaster, and Johannes Damascenus regarded the ecclesiastical books not found in the Hebrew Bible as noncanonical, and Jerome, whose learning gave great weight to his opinion, called them apocrypha. But in practice little distinction was made between proto- and deutero-canonical books, as the writings of these fathers, the manuscripts, the versions, and the general usage show. The Greek Orthodox church has continued the somewhat vacillating attitude of the early Greek fathers. Jugie seeks to account for the exclusion of the deutero-canonical books from the Russian Bible and the frequent failure to recognize them in Greece by Protestant influence. But Ph. Meyer (*Theologische Literaturzeitung*, 1909, pp. 490 ff.) has shown that Cyril Lucaris, who was influenced by Protestantism, in theory rejected, but in practice used, these books, and that men like Metrophanes Critopolus, Korais (a very independent and scholarly theologian), Eugenius Bulgarius, and Athanasius Parsios, were not Crypto-Protestants, but only influenced by the attitude of Athanasius, Gregory of Nazianzus, and Johannes of Damascus. The Russian church is also more likely to have been influenced by opposition to Rome than by Protestantism. In the Roman Catholic church during the Middle Ages the canonicity of these books was questioned or denied by Notker (died 912), Peter of Clugny (died 1185), John of Salisbury (died 1180), Hugo a S. Caro (died 1260), Nicolas Lyranus (died 1341), and others, but in the main their authority was upheld. Cardinal Cajetan (died 1534) also followed Jerome. But at the fourth session of the Council of Trent, in 1546, the decision of the African councils in the time of Augustine was reaffirmed,

and the deuterocanonical books were recognized as of equal authority with the protocanonical. The Prayer of Manasse and 3 and 4 Esdras were not counted among them. It has been maintained that 3 Esdras was excluded through a misunderstanding, since Augustine quotes it as Scripture (*De Civitate Dei*, xviii, 36); but this is not certain. Even after the Tridentine Council a distinction has been thought justifiable by Lamy, Jahn, and others, though the language used in the decree does not seem to admit of the construction they have attempted to put upon it.

The decision of the Roman Catholic church was no doubt to some extent influenced by the attitude of the Reformers, as that of the African councils had been affected by the position taken by Jerome. Carlstadt had pursued the question historically and pointed out the distinction made in the early church. Luther was also led by his opposition to certain doctrines that found their support in the deuterocanonical books. He translated them, and declared them to be valuable for purposes of edification, but not for the establishment of doctrine, and he placed them in an appendix by themselves. The distinction he made, which was essentially the same as had already been made by many eminent fathers and medieval teachers, was expressed in the Gallic Confession of 1559, the Anglican Confession of 1564, and the Second Helvetic Confession of 1564. More radical was the action of the Council of Dort (1618), which declared them to be human works and likewise apocrypha, and the Westminster Confession (1648), which maintained that they were not inspired, did not belong to the canon, and had no more authority than any other human writings. Nevertheless Protestants had the opportunity of reading these books until the struggle about their canonicity in the beginning of the nineteenth century led the London Bible Society in 1826 to discontinue the spread of any Bible that contained these books. The example was followed, though less rigidly, on the continent of Europe, and the effect, in an era of unprecedented missionary activity on the part of the Protestant denominations, was to deprive converts abroad as well as members of these churches at home of access to the deuterocanonical books. The Church of England, however, always permitted the use of readings from them. When the Revised Version was made, they were also translated, but published separately. In recent years their value has been more and more appreciated, and an International Society for the Apocrypha has been established on whose council are many bishops of the Church of England as well as English, American, and German scholars. The interpretation of these books for a long time suffered greatly from the controversy as to their canonicity. Roman Catholic scholars felt themselves in duty bound to defend the historical accuracy of every statement occurring in them and often had to resort to violent textual emendations, improbable interpretations, and questionable apologetic methods, while Protestant scholars took an unseemly delight in exhibiting historical inaccuracies, and lost all sense of their beauty and power in the anxiety to show their unworthiness of a place in the canon. The spirit that teaches men to approach all such Scriptures with reverence and yet with critical judgment is to-day bringing about a healthy coöperation of scholars, representing very different doctrinal positions, but eager to

find out what the original text was, what the authors meant to say, and what the real significance of their writings is. Even that larger circle of books which won canonical recognition only in some smaller church province receives at present careful study on the part of Roman Catholics and Protestants alike. (See APOCRYPHA.) The great collections of Kautzsch and Charles are valuable aids to the study of this literature. It would be an advantage, however, if the historically justifiable and unobjectionable term "deuterocanonical books" could be substituted for "apocrypha," which has no special appropriateness as applied to them and only causes needless offense. See BARUCH; ECCLESIASTICUS; JUDITH; MACCABEES; SOLOMON, WISDOM OF; BEL AND DRAGON; SUSANNAH; DANIEL; ESTHER, DEUTEROCANONICAL FRAGMENTS OF; and consult: Diestel, *Geschichte des Alten Testaments in der christlichen Kirche* (Jena, 1869); Cornely, *Introductio in U. T. libros sacros I* (Paris, 1894); Kautzsch, *Die Apokryphen und Pseudepigraphen des Alten Testaments* (Tübingen, 1900); Andrée, *Les apocryphes de l'ancien testament* (Paris, 1903); Jugie, *Histoire du canon de l'ancien testament dans l'église grecque et l'église russe* (ib., 1909); Charles, *The Apocrypha and Pseudepigrapha of the Old Testament* (Oxford, 1913).

**DEUTERONOMY.** The name of the fifth book of the Pentateuch, derived from the Greek translation of the two Hebrew words in Deut. xvii. 18, which signify "repetition of the law." Deuteronomy contains the last injunctions of Moses to his people, delivered in the land of Moab. With the exception of chaps. xxvii-xxviii, xxxiv, and a few verses elsewhere, the book is in the form of an address. There are, however, in reality, three distinct speeches. (a) chaps. i-iv, (b) chaps. v-xxvi; (c) chaps. xxix-xxxii; together with two poems, chaps. xxxii and xxxiii. The book closes with an account of the death of Moses (chap. xxxiv). It was already recognized by some of the Church fathers, e.g., Chrysostom and Jerome, that Deuteronomy is the book referred to in 2 Kings xxii as having been found in the eighteenth year of Josiah (620 B.C.) by the High Priest Hilkiah. (See JOSIAH.) But while critics are now unanimous in dating the beginning of Deuteronomy from this period, it does not follow that the book, as we have it, was composed in the days of Josiah. In the first place, the law book brought to the King could not have been as extensive as the present book of Deuteronomy. The two poems are clearly additions, and the same may be said of the short prophetic discourse in chaps. xxix-xxxii, and of the blessings and curses, chap. xxvii. There remain the two speeches, (1) chaps. v-xxvi, to which chap. iv. 45-49 forms the introduction, and (2) chaps. i-iv. Since the former discourse contains no reference to the latter, the two are independent of one another; other evidence can also be brought forward. Between the two the choice is not difficult. Since Hilkiah speaks of a "book," a document of some bulk is evidently intended, and the references to specific laws in the narrative of 2 Kings confirm the view adopted by most critics that chaps. v-xxvi represent the law book of Hilkiah, which may have been composed in the earlier years of Josiah's reign or possibly under Manasseh or Hezekiah. This discourse may be again divided into two sections: (a) chaps. v-xi;

(b) chaps. xii-xxvi. The former is an historical narrative put into the mouth of Moses; the latter an exposition of the law. The two divisions, however, formed an organic whole, and everything points to a single origin for them. The historical narrative forms the justification, as it were, for the authority claimed for the law. Naturally, even in this original portion of Deuteronomy, insertions and amplifications have been introduced by those who in the course of time enlarged the book by adding to it the other discourses, the blessings and the curses, and the poems: and who inclosed the whole in an historical frame and attached it to the four preceding books. (See EXODUS; LEVITICUS; NUMBERS; PENTATEUCH.) In these codes three distinct strata are recognized: (a) Ex. xxi-xxiii, called the Book of the Covenant; (b) Lev. xvii-xxvi, the Law of Holiness; (c) various priestly regulations found here and there in Exodus, Leviticus, and Numbers. Hence a question arises as to the position to be accorded to the original Deuteronomic code. As a result of the investigations of modern scholars—notably Kuenen, Graf, Wellhausen, and Stade—it may now be regarded as definitely established: (1) that Deuteronomy is older than (b) and (c), but younger than (a); and (2) that the Deuteronomic code is based upon the Book of the Covenant, enlarged and adapted to new conditions and introducing as an entirely new feature the recognition of Jerusalem as the only legitimate centre of Yahwe worship. Everything points to Jerusalem as the place where the original Deuteronomy was written, and there is nothing strange in the supposition that, as a result of prophetic agitation for the purification of Yahwe worship, an attempt should have been made, particularly after the profound impression made in Judaea by the catastrophe to the northern kingdom, to formulate an ideal code which should carry out the views of the Yahwe purists, and since the prophets pointed to the days of the wanderings in the wilderness as the period when the people showed the greatest fidelity to Yahwe, it was also natural that the tradition should arise and gather strength which ascribed the Deuteronomic code, as subsequently the other codes, to the great leader of the past, Moses. It is this tradition which, shaping the subsequent history of Israel, gave to the codes their authority in the eyes of the people. How long after this the second discourse (chaps. i-iv) was added has not yet been ascertained by the investigations of scholars, though it probably dates from the exilic period. The same may be said of chap. xxix, while chap. xxxiii appears originally to have been the conclusion to the enlarged book. Chap. xxxiii is an independent composition, which again impresses one as the natural conclusion of a book, and is therefore a "doublet" to chap. xxviii. It may be admitted that the problems involved in the relationship of these two chapters (xxviii-xxxiii) to the rest of the book have not yet been satisfactorily solved, and further investigations are needed. Of the poetic supplements, (a) the Song of Moses and (b) the Blessing of Moses, the former is now regarded as an exilic or even postexilic composition, while the latter is considerably older and reflects political conditions as they existed in the days of Jeroboam II (782-743 B.C.), before the disappearance of the northern kingdom.

**Bibliography.** Consult, besides the commentaries of Dillmann, Driver, Keil, Oettli, Montet, Steuernagel, etc., Stark, *Das Deuteronomium* (1894); Steuernagel, *Der Rahmen des Deuteronomiums* (1894); Addis, *Documents of the Hexateuch*, vol. ii (1898); A Harper, *Book of Deuteronomy* (1900); Stade, *Biblische Theologie des Alten Testaments* (1905); Boetticher, *Das Verhältnis des Deuteronomiums zu 2 Kön. 22-23 und zur Prophetie Jeremias* (1906); Klostermann, *Der Pentateuch II* (1907); Cornill, *Einleitung in das Alte Testament* (1907); Puukko, *Das Deuteronomium* (1910); Driver, *Introduction to the Old Testament* (1910); Sellin, *Einleitung in das Alte Testament* (1911); Jordan, *Commentary on the Book of Deuteronomy* (1911).

**DEUTSCH**, doich, EMANUEL OSCAR (1829-73). A distinguished Semitic scholar. He was born of Jewish parents, at Neisse, in Silesia. His education was begun by an uncle, to whose inspiration he owed his interest in Oriental languages and literature, and was finished at the University of Berlin. In 1855 he was called to England to fill an appointment in the library of the British Museum and labored there until his death in 1873. He acquired an extraordinary mastery of the whole range of Hebrew, Aramaic, and Rabbinical literature, and is best known for his articles on the Talmud and Islam in the *Quarterly Review*. He also wrote excellent articles on the Targum and the Samaritan Pentateuch for Smith's *Dictionary of the Bible*. The monument of his official work in the British Museum is to be found in the *Phœnician Inscriptions*, edited by Mr. Vaux, to whom Deutsch rendered most valuable assistance. His engrossing public duties and comparatively short life prevented Deutsch from fulfilling the dream of his life, an elaborate work on the Talmud. Consult his *Literary Remains*, containing reprints of his most important articles, with memoir (London and New York, 1874). The essay on the Talmud has also been reprinted by the American Jewish Publication Society, *Special Series No. 3* (Philadelphia, 1897).

**DEUTSCH**, LEO GRIGOREVITCH (1855- ). A Russian revolutionist. He was born at Kiev, where, too, he received his education. In 1874 he joined the Russian revolutionary movement and two years later was arrested, ostensibly for deserting the army (in which he served as a volunteer), but really for his revolutionary sympathies. He escaped, however, while awaiting trial by court-martial. In 1877 he, together with another famous revolutionist, undertook to organize a revolt among the peasantry in the Government of Kiev. When this secret organization was discovered, Deutsch was again arrested, this time for a real political offense punishable with death; a year afterward, however, while still lingering in the Kiev prison pending trial, he again made his escape. Going to Switzerland, he joined a group of Russian terrorists known as the Land and Liberty party, became a Socialist, and in 1883 helped to found the Russian Social-Democratic party in Switzerland. A year later, while conveying literature of this new organization, he was accidentally arrested in Germany and, through the influence of Prince Bismarck, extradited to Russia. He was sent to Siberia for 13 years and 4 months, but once more outwitted his guards in 1901 and again fled, by way of

Japan and America, to Switzerland. There he rejoined the Socialist party and became connected with its leading organ, the *Spark*. In 1905, much encouraged by the Czar's manifesto promising Russia a constitution, Deutsch returned to his fatherland. The reaction that came in 1906, however, again made him a political prisoner. On the way to Siberia, whither he was being exiled, Deutsch eluded his convoy and fled to France. In 1911 he came to the United States and for a year edited the newly founded Russian Socialist weekly, *Novy Mir*. An interesting account of his 40 years of revolutionary activity, including his prison life and thrilling escapes will be found in his *Sixteen Years in Siberia* (New York, 1903) and *Viernal Entföhen* (Stuttgart, 1907).

**DEUTSCHEROD**, doich'bröt. The capital of a district in Bohemia, Austria, on the Sazawa, 16 miles north of Iglau (Map: Hungary, D 2). It has woolen factories, lumber and grist mills, glassworks, and breweries. The chief event in its history is the defeat of the Emperor Sigismund by Ziska in 1422, and the destruction of the town by the Hussites. Pop., 1900, 6526.

**DEUTZ**, doits. See COLOGNE.

**DEUTZIA**, düt'si-a or doits'i-ä (after the Dutch botanist Deutz). A genus of shrubs of the family Saxifragaceæ, natives of the north of India, China, and Japan. They produce an abundance of beautiful white flowers. The leaves of *Deutzia scabra* are so rough with siliceous hairs that they are used by joiners in Japan for polishing wood. *Deutzia scabra* and *Deutzia gracilis*, of which there are numerous varieties, including some with rose-colored flowers, are common ornamental shrubs in the United States. Other species are often used for forcing in greenhouses.

**DEUX-PONTS**, də'pôn'. See ZWEIFBRÜCKEN.

**DEUX-SÈVRES**. See SEVRES.

**DĒV**, dāv, less accurately **DĒW**, or **DĪV**. The Persian word for demon, identical with Avestan *daēva*, and the same as Sanskrit *dīva*, Avestan *daēva*, although the latter means "god," not "demon." According to Zoroaster the *Daēvas* were created by Ahriman (q.v.), and in Ferdousi's Persian epic, *Shāh Nāmāh*, the *Dēvs* are a constant source of guile, cunning, evil, and alarm. The difference in meaning between the usage of the word in Iran and India has been much discussed. Consult Geiger and Kuhn, *Grundriss der iranischen Philologie*, vol. ii (Strassburg, 1896-1904). See AVESTA; ZOROASTER.

**DĒVA**. The old Roman name for Chester and the river Dee.

**DĒVA-DĀSĪ**. See BAYADERE.

**DĒVANĀGARĪ**, dā'vā-nā'gā-rē, or **NĀGARĪ**. The name given to the character in which Sanskrit is generally written, especially in northern and middle India. The Hindus commonly employ the second term rather than the first. The word *nāgarī* means "of the city, urban" (writing); *dēvanāgarī* signifies "(writing) of the divine city." As the Arab chronographer Al-Bīrūnī in his account of India (about 1030 A.D., trans. Sachau, i, 173) mentions a kind of writing called *Nāgarā* as in use in Mālwa, whose chief city is Ujjain, it has been thought that the name of this script, urban, *urbane*, may possibly have some connection with King Vikrama's capital, which was a famous seat of learning and literature. The Nāgarī alphabet

consists of 48 letters, and it is written from left to right. It is believed to have assumed its present characteristic form about the eighth century A.D., and, like the other Hindu scripts, it is traceable back to the oldest form of Indian alphabet, the *Brahmi līpī*, or Writing of Brahma, which is known from coins and inscriptions of about 350 B.C. The Brahmi itself is held to be an adaptation of a form of Semitic writing that may perhaps have found its way into India as far back as the eighth century B.C. In modern times one of the earliest instances of Dēvanāgarī letters being employed in a printed European book is found in five tables contributed to Kircher's *China illustrata* (Amsterdam, 1667) by Heinrich Roth, a German who had lived a number of years in India as a missionary. On the Nāgarī script and its paleographic sources, consult the standard work of Bühler, *Indische Paläographie* (Strassburg, 1896), and Taylor, *The Alphabet*, vol. ii (London, 1899), who is the exponent of a view differing from that of Bühler. See ALPHABET, SANSKRIT.

**DEVAPRAYAGA**. See DEOPRAYAG.

**DEVAUX**, də-vô', PAUL LOUIS ISIDOR (1801-80). A Belgian statesman. He was born at Bruges and was educated at Liège. The establishment of the so-called "Doctrinal party" after the revolution of 1830 was largely due to his efforts and to those of his chief associates, Rogier and Lebeau, with whom he had six years previously founded the *Journal Politique*. This publication, by unifying the Liberal and Catholic elements, agitated the opposition to King William I of the Netherlands and eventually became largely instrumental in promoting the separation from Holland and the establishment of an independent government. Devaux assisted in framing the constitution and in the negotiation of the Treaty of London. In 1831 he became Minister of State, resigning upon the installation of King Leopold, whose election he had advocated. He later became the head of the Moderate Liberals in the Chamber, and for many years conducted the official organ of that party, the *Revue Nationale*, founded by him in 1840. Towards the close of his career he was stricken with blindness. His publications include: *Mémoires sur les guerres médiques* (1874), and *Etudes politiques sur les principaux événements de l'histoire romaine* (1880).

**DĒVAY**, dā'voi, or **DĒVAI** (i.e., of Dēva), MÁTYÁS BIRÓ (c.1500-74). The founder of the Reformed church of Hungary. He was born at Dēva, Transylvania, studied theology at Cracow, became a priest, but in 1529 embraced the Reformation, and spent nearly two years with Luther at Wittenberg. On his return home he preached the new faith boldly and at the risk of his life until, in 1534, he came under the protection of a powerful noble. In 1541 he fled to Switzerland to escape the oncoming Turks and there imbibed Zwingleian views of the sacraments, much to Luther's sorrow. He died at Debreczin, Hungary, where he had faithfully labored for a few years.

**DEVELOPMENT**, EMBRYONIC. See EMBRYOLOGY; GASTRÆA THEORY.

**DEVELOPMENT**, EVOLUTIONARY. See EVOLUTION.

**DEVELOPMENT IN PHOTOGRAPHY**. See PHOTOGRAPHY.

**DEVELOPMENT OF DOCTRINE**. The process by which Christian doctrine has been

slowly and successively divided into different departments of thought, these one after another more carefully defined, subdivided, and elaborated, and more thoroughly grounded in revelation and reason, and the whole thereby reduced to a systematic and relatively complete form.

The fact of such a development is at once evident upon the most superficial examination of Christian history. The earliest writers of the Church possess no system of theology and employ few expressions which indicate any thought upon the great questions with which theology is engaged. The development has proceeded with unequal pace; now one subject and now another being the centre of attention. In a sense it is true that heresies have determined the development of doctrine: for a heresy must be met by a more careful study and restatement of the doctrine attacked. Such a study is seldom without modifying influence upon the form in which the doctrine is held.

In the second century Gnosticism (q.v.) came into Christianity and compelled the formation of the New Testament canon and the statement of the relation of Christianity to Judaism. The fourth century brought a discussion of the relation of Christ to God, resulting in the formation of the Nicene Creed. The fifth century brought the completion of Christology (q.v.) by the definition of the relation of the divine nature of Christ to his human nature, culminating in the Creed of Chalcedon (451). Augustine formulated the doctrines of grace and of original sin, under the influence of the Pelagian controversy; and of the Church, under that of the Novatian controversy. The doctrine of the Church took more definite form in the Middle Ages, when the doctrines of the sacraments were defined. The doctrine of the atonement was first clearly stated by Anselm (1098). The Protestant Reformation caused a twofold development. On the Catholic side it issued in a formulation and statement, in the Creed of the Council of Trent, of the ecclesiastical and sacramental interpretation of Christianity. This statement was so full that Catholic development of doctrine has proceeded more slowly since then, the most prominent points being the definition of the doctrine of the immaculate conception (1854) and of the papal infallibility (1870). The Protestants formulated anew the doctrines of the Church, the priesthood of believers, the sacraments, and justification by faith. Both Luther and Calvin regarded their doctrines, not as new developments, but only as restatements of biblical and Augustinian positions. Calvin emphasized the sovereignty of God. This led to the Arminian protest against any doctrine which destroyed a real free will. This controversy was one of the factors in the development of the New England theology, which gradually modified Calvinism, till little of its old form was left. Modern times have produced, instead of developments of special doctrines, an attitude towards all doctrines which demands (1) that they be made ethical. This has caused changes in the doctrines of everlasting punishment and of the atonement. (2) That they be in accord with present philosophical conceptions, as in the case of the problems of free will. (3) That they be so stated as to possess a practical value for life.

Two theories of development have been held. One is best expressed in English in Newman's

famous *Essay on Development*. It holds that all doctrine was latent in the teaching of Christ and the Apostles, but that it unfolds gradually under the guardianship of a divinely inspired and infallible Church. Protestants have often held a modification of this theory, regarding all true Christian doctrine as lying in the New Testament, but denying the infallibility of the Church. The other theory holds that doctrine has developed under natural influences, and that the results may be at some points quite out of accord with the spirit of the gospel. Consult: Cardinal Newman, *An Essay on the Development of Christian Doctrine* (London, 1878), and criticism by Prof. F. H. Foster in his *Christian Life and Theology* (New York, 1901); Brown, *The Essence of Christianity* (ib., 1902); Allen, *The Continuity of Christian Thought* (Boston, 1884). See CREEDS AND CONFESSIONS.

DEV'ENS, CHARLES (1820-91). An American jurist and statesman. He was born in Charlestown, Mass., graduated at Harvard in 1838, and was admitted to the bar in 1841. He was a member of the State Senate in 1848-49, and from 1849 to 1853 was United States Marshal for the District of Massachusetts. In this capacity he was called upon in 1857 to remand Thomas Sims (q.v.) to slavery and strongly against his own inclination caused the process to be executed, but subsequently made every effort to secure Sims's freedom. He served with the Union army in the Civil War from 1861 to 1866, rose from the rank of major to that of brigadier general, and was brevetted major general. At the conclusion of the war he resumed the practice of law, was associate justice of the Superior and Supreme courts of Massachusetts from 1867 to 1877, and was United States Attorney-General under President Hayes from 1877 to 1881. From that time until his death he was again in the State Supreme Court. He was a brilliant orator and public speaker. In 1886 he presided over the exercises in celebration of the two hundred and fiftieth anniversary of Harvard University. Consult his *Orations and Addresses*, with a memoir by John Codman Ropes (Boston, 1891).

DEVENTER. A thriving town of Holland, situated at the junction of the Schepbeek and Yssel, 66 miles east of Amsterdam (Map: Netherlands, E 2). The town retains the mediæval plan of streets, but is very neat. The principal buildings are the early Gothic church of St. Lebuinus, the Brothers' Church, and the Bergkerk of the twelfth century, the townhouse, the courthouse, and the Gothic weigh-house, now a high school for girls. There are a number of carpet factories and a Royal Smyrna rug factory. Erasmus received his early training at Deventer. The town is also famous throughout the country for its honey cakes, a kind of gingerbread, called "Deventer koek." Other industries are iron molding, cotton spinning, cigar manufactures, rope making, and glue making. There is also a large trade in grain, linen, and animal products. Pop., 1900, 26,212; 1910, 28,223. Deventer is mentioned as early as the eighth century, when it was taken by the Saxons. It was the seat of a bishopric from 1559 to 1561.

DE VEE, *de ver'*, SIR AUBREY (1788-1846). An Irish poet. He was the son of Sir Vere Hunt of Curragh Chase, Limerick, Ireland. In 1832 he took the name of De Vere. He

studied under a tutor at Ambleside and subsequently at Harrow. His sonnets were greatly admired by Wordsworth. He also wrote three dramatic pieces: *Julian the Apostate* (1822); *The Duke of Mercia* (1823); and *Mary Tudor* (posthumous, 1847). Consult *Sonnets* (1875) and *Mary Tudor* (1884), edited by his son, Aubrey Thomas de Vere (q.v.). Consult also Gunning, *Aubrey De Vere* (Limerick, 1902), and Ward, *Aubrey De Vere* (New York, 1904).

**DE VERE, AUBREY THOMAS** (1814-1902). An Irish poet, son of Sir Aubrey De Vere, and second Baronet of Curragh Chase, Limerick. Educated at Trinity College, Dublin, he first appeared as a poet in 1842, with *The Waldenses*. Next year his *Search after Proserpine* made him widely and favorably known as a writer of verse, graceful, refined, and fluent. Among later volumes are: *Poems, Miscellaneous and Sacred* (1853); *The Sisters* (1861); *Irish Odes* (1869); *Legends of Saint Patrick* (1872); *Legends of the Saxon Saints* (1879); *The Foray of Queen Meave and Other Legends of Ireland's Heroic Age* (1882); and *St. Peter's Chains* (1888), which enriches England's rather slender store of devotional verse of fine quality. De Vere also published poetical dramas on *Alexander the Great* (1874) and *Saint Thomas of Canterbury* (1876), which show no marked dramatic gift; *Essays Chiefly on Poetry* (1887); *Essays Chiefly Literary and Ethical* (1889); and *Recollections* (1897). Many of his best poems, edited by G. E. Woodberry, were published as *Selections* (New York and London, 1894). As a poet, he was inspired by Wordsworth. He was a classical scholar of fine culture, and his appreciation of the Greek spirit is manifest in all his work relating to those ancient myths. Of permanent practical achievement may be mentioned his interest in the Celtic renaissance, and not the least attractive of his poems are those reviving the beauty of Irish legend. Consult: *Recollections* (London, 1897); Brooke and Rolleston, *Treasury of Irish Poetry* (New York, 1900); W. P. Ward, *Aubrey de Vere* (New York and London, 1904).

**DE VERE, MAXIMILIAN SCHELE** (1820-98). An American philologist. He was born in Sweden, studied in Germany, and in 1842 emigrated to the United States. In 1844 he became professor of languages at the University of Virginia, but during the Civil War entered the Confederate army, and afterward acted as the Commissioner of the Confederacy in Germany. At the close of the war he resumed his professorship. He was one of the founders of the American Philological Society and published: *Comparative Philology* (1853); *Stray Leaves from the Book of Nature* (1856); *Wonders of the Deep* (1869); *Americanisms* (1872); *Romance of American History* (1872); several translations from Spielhagen; X. B. Saintine's *Myths of the Rhine* (1874).

**DEVEREUX, dé'ver-əs, PENLOPE.** See STELLA; also, DARK LADY, THE.

**DEVEREUX, ROBERT.** See ESSEX, third EARL OF.

**DEVI, dá've** (Skt., goddess), or **MAHADEVI, má'há-dá've**. In Hindu mythology, the wife of Shiva, also called Durga and Parvati.

**DEVIATION** (Lat. *deviatio*, from *deviare*, to go out of the way, from *de*, off + *via*, way). The deflection of the compass needle, due to local attraction, such as the magnetic forces of

an iron or steel ship. It consists of two parts—that produced by permanent magnetism of parts of the vessel's structure and that produced by induced magnetism in other parts. The *angle of deviation* is the angle between the magnetic meridian and the compass needle. (See COMPASS; DECLINATION; MAGNETISM, TERRESTRIAL.) The term also may signify a departure from the usual course of a voyage without justifiable cause; if lack of sufficient cause is proved, the insurers are discharged from all further responsibility. It differs from a *change of voyage*, which is planned and decided upon before the sailing of the ship. Permission to touch at, stay at, or trade in any particular place not in the usual course of the voyage must be expressly given in the contract. Deviation is justified by the following causes: (a) stress of weather; (b) urgent need of repairs; (c) to join convoy; (d) to succor ships in distress; (e) to avoid capture or detention; (f) sickness; (g) mutiny of the crew.

**DEFLECTION OF THE PLUMB LINE.** See DEFLECTION OF THE PLUMB LINE.

**DEVICE'** (ME. *devise*; OF. *devise*, will, intention, *devis*, division, plan, will, from Lat. *divinus*, p.p. of *dividere*, to divide). An emblem which, with its accompanying motto or legend, was assumed as an ingenious expression, generally containing a hidden meaning of some particular conceit of the wearer. Devices became general in the fourteenth century and reached their full development during the period of the French wars in Italy. Mary Stuart solaced her captivity by inventing devices which she afterward executed in embroidery. A device was composed of two parts—the body and soul, as they were called by the Italians. The body, or painted metaphor, was not to represent the human form, but was to be pleasing in appearance. The soul was to be short and in a foreign language. The combined emblem was not to be so plain as to be understood by all, nor so obscure as to require a sphinx to interpret it. Devices were borne only by the person who assumed them, and not, like the crest or cognizance, by his family or descendants. Thus, Louis XIII of France had a falcon as a device, with the words *Aquila generosior ales* (a nobler bird than the eagle), by which he implied a claim of superiority to the Emperor; Louis XIV had the sun in its splendor, with the motto *Nec pluribus impar*. Consult Radowitz, *Die Devisen und Mottos des spätern Mittelalters* (Stuttgart, 1850).

**DE VIGNY, de vè'nyé', ALFRED, COMTE.** See VIGNY, ALFRED, COMTE DE.

**DEVIL, or SATAN** (OE. *deofol*, Lat. *diabolus*, Gk. *δίαβολος*, *diabolos*, slanderer, from *diá*, *dia*, across + *βάλλειν*, *ballein*, to throw; Heb. *Sátán*, adversary, from *satan*, to persecute). In later Jewish and Christian belief, a mighty spirit of evil who has during unknown ages ruled over a kingdom of evil spirits and is in constant and restlessly active opposition to God. This belief, however, was very gradually developed in the Jewish mind; and it is beyond all question that it acquired clearness and prominence through extraneous influences. The older Hebrews who lived before the period of the Babylonian captivity—judging from the silence of Scripture—knew nothing, and certainly taught nothing, of evil spirits in the later sense—i.e., of beings separated from God, who were evil in the essence of their nature and worked

evil only. Moral evil was rather looked upon as properly the act of man; physical evil, or adversity, on the other hand, as punishment merited through sin and inflicted by a just and holy God, who was thus necessarily conceived as the true source of all calamity. The angels who foretold God's purposes and executed His will, however great might be the physical evil they occasioned, are never accused of moral evil. The spirit from God which brought insanity upon Saul (1 Sam. xvi. 14) was called "evil" because of its effect, not its moral nature. It is probable that the Hebrews conceived of spirits like the Arabic jinn haunting lonely places, but there is little demonology till the period of the exile, when they came into contact with the vigorous demonism of Babylonian and Persia. Then appears for the first time an angel called *Satan*, who, however, still figures as a minister of God and, along with the others, appears in heaven before the throne of Jehovah, but with the function assigned to him of accuser and seducer. It is he who (1 Chron. xxi. 1) stirs up David to number the people; while in the older Hebrew version (2 Sam. xxiv. 1) the same act is attributed to an angry God. Satan also throws suspicion on the piety of Job and, with the permission of Jehovah, causes a series of misfortunes to befall him (Job i. 2); while in Zach. iii. 1 he is represented as "resisting" the angel of God and as a false accuser of the high priest Joshua. As yet, however, an evil nature is not expressly ascribed to him, although it is assumed that he takes a pleasure in evil. It is a purely arbitrary and untextual interpretation of Isaiah xiv. 12 ("How art thou fallen from Heaven, O Lucifer, son of the morning!") that would force these words to refer to the fall of the Devil or determine from them his name. In the Apocrypha, of which only a small part is Palestinian, the rest being either *Chaldaeo-Persian* (as, e.g., Tobias and Baruch) or *Egypto-Alexandrian* (as, e.g., Wisdom) in its origin, the older Hebrew doctrine of misfortune coming from the angel of Jehovah disappears, and demons or evil spirits, in the New Testament sense of the term, are for the first time mentioned (and in Tobias and Baruch frequently) as the authors of calamities. According to the representations of these writings, the evil spirits dwell in waste places, but associate themselves for the injury or destruction of men, enter into them as tormentors, and can be expelled only by magical or mysterious means. To this class of beings the heathen deities were reckoned to belong. But even here there is no mention of an organization or kingdom or prince of demons. The first trace of a *Diabolos* or Devil proper (and one in all probability springing from a foreign source) shows itself in the Book of Wisdom (ii. 24), in relation to the seduction of Eve, where it is said that through the Devil the necessity of death has come into the world.

During the period immediately preceding the appearance of Jesus the Jewish ideas of angels, as well as of demons and the Devil, received an extensive development. Much of this angelology and demonology, wholly foreign to the older Hebrew religion, was derived from Persian Zoroastrianism. The idea of spiritual hierarchies and orders, and the names of specific spirits and demons, as *Aasmodeus* in Tobias, are drawn from the Persian system. In Persia the

evil power was supposed to have existed from the beginning, but to be destined to defeat at last. The Hebrew represented the Devil and his demons as having been originally *angels*, who had fallen from their "high estate," been punished by God, and had therefore assumed a position of hostility, without, however, being able materially to frustrate the divine purposes. These opinions found an almost universal reception among the people. Indeed, the only Jewish sect which rejected them was that of the Sadducees, who considered them, as also the doctrines of the resurrection from the dead, of the Messiah, of the Messianic kingdom, of the last judgment, of rewards and punishments, and of angels and demons, to be new, outlandish anti-Mosaic myths and theories. This conflict of opinion among the Jews prevented their ideas of the Devil and demons from obtaining, in spite of their broad diffusion, a dogmatic and systematic stability. The populace and the Pharisees believed fervidly in the existence of such evil spirits; but their conceptions had not only all the heat, but all the confusedness of superstition.

The New Testament contains distinct recognition of the prevalence of this extended popular demonology, by which, in particular, various diseases were ascribed to the agency of the evil spirits. (See DEMONIAE.) The chief demonic power bears a great variety of names, as *Satan* (Matt. iv. 10 et seq.), the Devil (as Heb. ii. 14), the Adversary (1 Pet. v. 8), the Enemy (Matt. xiii. 39), the Adversary (1 Tim. v. 14), the Accuser of the Brethren (Rev. xii. 10), the Old Serpent (Rev. xx. 2), the Great Dragon (Rev. xii. 9), frequently *Beelzebub* (Matt. x. 25), once *Belial* (2 Cor. vi. 15). These names describe well the character imputed to him. He is the "evil one," the "tempter," who opposes Jesus and seeks to draw the disciples as well as their Saviour into sin, has power over the world, of which he is the "Prince" and "God," and shows his power in the moral corruption of heathenism.

The primitive Church assumed the personality of the Devil as an unquestionable fact. The New Testament ideas on this point were not only greatly enlarged, but in many respects entirely changed, partly through the introduction of a considerable number of heathen notions, and partly through the dogmatic tendencies of the time, in consequence of which the various statements in the Bible regarding Satan and evil were uncritically and unhistorically heaped together, and a doctrine of satanic agency elaborated logically. Holding firmly to the belief of a satanic kingdom of darkness opposed to Christ's kingdom of light, the majority of the early Christians ascribed all evil, physical as well as moral, to the Devil and his demons: failures of the crop, sterility, pestilence, murrain among cattle, mental maladies, persecutions of the Christians, individual vices, heresies, astrology, philosophy, and especially the whole body of heathenism, with its mythology and religious worship. The heathen gods were believed to be conquered by the work of Christ, but not to be wholly powerless; they sank down into demons, and so a part of their mythology passed into the doctrine of the Devil. It was they who, as demons, meaning to deceive, uttered oracles, were present at sacrifices, and inhaled the sacrificial incense. The doctrine of the lordship of the Devil over the human race, so

far as it was unregenerate, gave rise to the custom of exorcising, not only those in whom special signs of demoniacal possession appeared (see *EXORCISMS*), but all candidates for baptism, whether infants or adults. (See *EXORCISM*.) But while the power of the Devil over all not guarded by Christian faith and rites was supreme, over those who were so protected it was utterly weak. No Christian, even the weakest, could be forced to do evil; and the sign of the cross, the commemoration of Satan's defeat in the decisive combat, sufficed to put him to flight. During the Middle Ages theologians speculated as to the reason for the fall of Satan. Some held that he was originally the highest of all angels; others, that he was a prince in one of the lower orders. Pride was usually assigned as the reason for the revolt which led to his fall. The general theological speculations on the subject are expressed in Milton's *Paradise Lost*.

The old German and Norse mythologies poured a flood of heathen fancies into the "doctrine of the Devil." Even Ulfilas, at a much earlier period, had translated the New Testament word *damon* or *daemonion* by *unhults*, i.e., she devil or sorceress, because the old Germans believed in female demons, while the Christian *usus loquendi* contains no trace of such. The peculiarly German conception of a now malignant, now gentle female lives to this day in the German phrase, "The Devil is beating his mother" (when rain and sunshine quickly alternate). In England and Scotland, too, the phrase is or was recently current, "The Devil and his dam." The Germans have also the proverb, "Where the Devil cannot come, there he sends his grandmother." Soon, however, the word *diabolus*, in violation of the New Testament distinction between it and *damon*, came to signify devils of every or any sort. The dwelling of the Devil was hell, which, however, according to old Germanic and Scandinavian notions, was placed in the dreary regions of the north. Although his mischievous powers are to be pretty well controlled till the coming of Antichrist, when he expects to hold carnival, yet, like ancient gods and demons, he occasionally appears on the earth. He then assumes at times a purely human form, but, like Vulcan, who was thrown down from heaven like himself, and the smith, Wieland, of German mythology, he is somewhat lame. He is covered with a gray, green, or red cloak, like the kobolds and dwarfs (see *GIANTS*; *DWARF*), the spirits of the suppressed heathenism; sometimes, also, he appears black and sooty, as befits his dwelling place and his opposition to a pure God. But as the old deities, both classical and German, possessed the power of transformation to a most remarkable degree, the Devil, through his relationship with these, inherited this power when they vanished from the scene. The form he most frequently assumed was that of an animal, approximating in this respect to the German forest spirits and the Greek satyrs and fauns. At one time he shows the foot of a horse or goat with horns and tail; at another he appears as a black horse, a he goat, a hog, a wolf, a hell hound, a raven, a serpent, a worm, a dragon, or a fly. The conception of the power of the Devil was vastly enlarged by the influx of these new fancies. In fact, it rose almost to a new dualism; but on the other hand, also, many mild and

friendly traits of the heathen gods passed over into the popular conception of the Devil and gave to his nature a quite new, humorous, and even merry side. As, after the introduction of Christianity, offerings were still occasionally made to the old gods, the Devil shared in these honors. A horse, a he goat, or a hound was at times sacrificed to him; and to the present day the expression has survived, "To kindle a fire for the Devil"—obviously an allusion to altar flames. Various features of the old Norse gods, especially of Loki and Donar (Thor), the gods of fire and thunder, were also transferred to him. Hence the still current phrases in Germany when thunder is heard: "The Devil must be striking," and "The runaway goose is gone to the Devil." (*Donner*, 'thunder,' is the word used for devil in this case.) Every power, too, which, according to the older heathen belief, was lodged in the lesser demons, giants, etc., had now its proper centre in the great fiend himself, who could perform all the pranks attributed to the more grotesque creations of the Norse mythology, and work all the evil of the more malignant spirits; but, in general, these beings were rather pressed into his service than absorbed by him or incarnated in his person.

Thus decked out in the costumes of many different climes and ages, the image of evil passed into the light of the modern world. In this light the Devil began to fade away. Men first lost faith in his occasional incarnation; then medical science destroyed his claims to the origination of mental phenomena, which he was once supposed to have caused directly; natural science deprived him of his control over the elements; historical criticism plucked from him his borrowed feathers; while philosophy and a study of the New Testament in its historical background have combined to annihilate his personality. The tendency has been to regard the personal Devil as a part of the mythology with which men in early times were wont to clothe the forces of the world in personal form. **DEVIL, TASMANIAN, or DEVIL-DEVIL.** See *DASYURE*.

**DEVIL, THE.** Once a tavern near Temple Bar, in Fleet Street, London, the former place of meeting of the Apollo Club (q.v.). Child's Bank now stands on its site.

**DEVILFISH.** A name applied to various large marine creatures of terrifying or grotesque appearance. 1. Any of various large cephalopods. See *KRAKEN*; *OCTOPUS*; *SQUILL*. 2. The gigantic ray (*Monta birostris* or *vampyrus*). See *RAY*. 3. The angler (*Lophius*), and its relatives. See *ANGLER*.

**DEVIL-IN-THE-BUSH.** See *NIGELLA*.

**DEVIL IS AN ASS, THE.** A comedy by Jonson (1616), the avowed object of which was to substantiate the thesis laid down by the title.

**DEVILLE, de-vel'. See** *SAINTE-CLAIRE DEVILLE*.

**DEVILLE, JEAN ACHILLE** (1789-1875). A

French scholar and antiquarian, born in Paris. He became director of the museum in Rouen. He wrote works on local history and archaeology, such as an *Histoire du Château-Gaillard* (1829); *Tombeaux de la cathédrale de Rouen* (1838); *Essai sur l'exil d'Osive* (1859); *Histoire de l'art de la verrerie dans l'antiquité* (1874)—the last-named volume, finely embellished with numerous plates, being his best.

**DE VILLIERS**, de vil'yärz, JOHN A. J. (1863— ). An Anglo-Dutch geographer, born in London, the son of a Hollander living in Cape Colony. He was educated at the City of London College, became superintendent of the map room in the British Museum, and was expert adviser to the British Foreign Office in the Venezuelan and Brazilian boundary arbitration cases. In 1911 he lectured throughout Holland. He published some translations from the French, notably Bourget's *Mémoires*, and edited for the Hakluyt Society—of which he was honorary secretary—early works on British Guiana, etc.

**DEVIL OF EDMONTON, THE.** See MERRY DEVIL OF EDMONTON, THE.

**DEVIL'S ADVOCATE.** See ADVOCATUS DIABOLI.

**DEVIL'S-APRON.** The large brown alge, usually called kelps, in the order Laminariales. See PHLEOPHYCEÆ. ALGÆ.

**DEVIL'S BIBLE, THE.** The name given to a manuscript Bible taken to Stockholm after the Thirty Years' War. It is beautifully written on 300 asses' skins, and the legend makes it the work of a monk condemned to death, who by selling himself to Satan was enabled to save his life by meeting the condition that he should copy the whole Bible on asses' skins in one night.

**DEVIL'S-BIT.** See SCABION'S.

**DEVIL'S BRIDGE** (translation of Ger. *Teufelsbrücke*). A curious bridge formerly in the Canton of Uri, Switzerland, over which the St. Gothard Railway crosses the Reuss at a point where there are often violent gusts of wind (Map: Switzerland, C 2). Built in the Middle Ages, it was partially destroyed by the French in 1799, in which year it was the scene of fierce conflicts between them and the allied Austrians and Russians. The remains of the bridge were carried away by a flood in 1888. "The Hole of Uri" is the name given to the tunnel near by, through which the road passes. The new bridge was built close to the old site in 1830, and a monument to the Russian general, Suvaroff, was erected in 1899 in a niche above.

**DEVIL'S-CLAW.** A heavy split hook attached to a chain or hawser and used for working the chain cable in mooring, unmooring, clearing hawse, etc. The points of the hook pass on each side of one link and grip the next one at right angles to it. The chain or hawser is secured to a bitt, ringbolt, capstan, windlass, or the like.

**DEVIL'S-CLUB.** See ABALIA.

**DEVIL'S-COACHHORSE,** or Cow. A rove beetle (*Ocypus olens*), common in Great Britain. See ROVE BEETLE.

**DEVIL'S DARNING NEEDLE.** See DRAGON FLY.

**DEVIL'S DOZEN.** See BAKER'S DOZEN.

**DEVIL'S DYKE.** 1. A prehistoric earthwork in Cambridgeshire, England, built as a barrier between the Mercians and the East Anglians. 2. A natural formation near Brighton,

said by a legend to represent the attempt of the Devil to let in the waters in order to inundate the country.

**DEVIL'S-FINGER.** A British name for (1) a belemnite; (2) a starfish.

**DEVIL'S ISLAND.** A small barren island off the coast of French Guiana, South America, about 30 miles northwest of Cayenne (Map: Guiana, French, G 2). It became famous through the confinement there of Capt. Alfred Dreyfus (q.v.). Near Devil's Island are the two small French penal islands of Saint-Joseph and Ile Royale, which were formerly known, with Devil's Island, as Iles du Diable, but which later received the name Iles du Salut.

**DEVIL'S LAKE.** A city and the county seat of Ramsey Co., N. Dak., 89 miles west by north of Grand Forks, on the Great Northern and the Farmers Grain and Shipping Company's railroads, and on Devil's Lake (Map: North Dakota, F 2). It contains a school for the deaf, a Carnegie library, St. Mary's Academy, General Hospital, and shops of the Great Northern. There are also creameries and grist mills. The city has adopted the commission form of government. Pop., 1900, 1729; 1910, 5157.

**DEVIL'S PARLIAMENT.** The name given to an English Parliament convened by Henry VI, which met at Coventry in 1459 and unjustly attainted the Duke of York and his adherents of high treason.

**DEVIL'S RIDING HORSE.** See PIRATE BCG.

**DEVIL'S THOUGHTS,** or **DEVIL'S WALK, THE.** A short doggerel of 14 stanzas written in collaboration by Southey and Coleridge (1799), republished in Coleridge's *Sibylline Leaves* (1817), and in Southey's poems with additional verses referring to Poison.

**DEVIL'S WALL.** The popular name for the Pfahlgraben, the old Roman wall between England and Scotland, because of its strength.

**DEVIL UPON TWO STICKS, THE.** An English adaptation by Foote of Le Sage's *Le Diable Boiteux*.

**DEVIL WORSHIPERS.** Specifically, a sect called Yezidis, living in Asiatic Turkey and Armenia, and claiming several hundred thousand adherents. Their religion is a survival of primitive worship of the evil mysteries, the essential feature of many savage and barbaric beliefs, though the chief object of their devotion is borrowed from the Old Testament, and the Koran. They practice circumcision and baptism.

**DEVINE, dé-vin',** EDWARD THOMAS (1867— ). An American leader in social work, born at Union, Iowa. He graduated in 1887 at Cornell College (Iowa), and from 1894 to 1896 was secretary of the American Society for the Extension of University Teaching. In 1896 he was appointed general secretary of the Charity Organization Society of New York, and in addition he was from 1897 to 1913 editor of *Charities*, later known as *Charities and the Commons*, and, since 1909, as *The Survey*. He was appointed professor of social economy at Columbia University in 1905, was director of the New York School of Philanthropy from 1904 to 1907, had charge of Red Cross relief work after the San Francisco earthquake and fire in 1906, served in the latter year also as president of the National Conference on Charities and Correction, and prominently identified himself with various congresses and organizations aiming to

better social conditions. He wrote: *Economics* (1898); *The Practice of Charity* (1901); *Principles of Relief* (1904); *Efficiency and Relief* (1906); *Misery and its Causes* (1909); *Social Forces* (1909); *The Spirit of Social Work* (1911).

**DE VINNE**, də vin'né, THEODORE LOW (1828-1914). An American printer, born at Stamford, Conn., and educated in the common schools of the various towns where his father had pastorates. He learned the printing trade in a shop at Fishkill, N. Y., and later was employed on the Newburgh (N. Y.) *Gazette*. In 1849 he entered the establishment of Francis Hart in New York City, and was a junior partner in the business from 1857 to 1877. The firm name having been altered in 1883 to Theodore L. De Vinne & Co., he removed in 1886 to a model plant designed by him on Lafayette Place. He began to print the *St. Nicholas Magazine* when it was founded in 1873, and the *Century Magazine* in 1874. He founded the National Typotheta Society, and was elected its president in 1896. A great advocate of what he called "masculine printing,"—good paper, bold, readable types, and simple composition, strongly printed in black ink, De Vinne did much for the improvement of American typography. For years his publications ranked at the head of American presswork, and his firm gained an international reputation. He was the most prolific of writers on printing, publishing besides a great many magazine articles: *The Invention of Printing* (1876); *Historic Printing Types* (1886); *Plain Types* (1890); *The Practice of Typography* (1900); *Correct Composition* (1901); *Title-Pages* (1902); *Modern Methods of Book Composition* (1904); and *Notable Printers of Italy during the Fifteenth Century* (1910). He contributed to the NEW INTERNATIONAL ENCYCLOPEDIA.

**DEVINS**, dəvinz, JOHN BANCROFT (1856-1911). An American clergyman and editor, born in Brooklyn, N. Y. In 1882 he graduated from New York University, and in 1880-88 he was a member of the staff of the *New York Tribune*. Ordained to the Presbyterian ministry in 1888, he served from that year until 1905 as pastor of churches in New York City. From 1890 to 1911 he was managing editor of the *New York Observer*. He organized the Federation of East Side Workers and the New York Employment Society, wrote several hymns, assisted in preparing the *Life of Dwight L. Moody*, and wrote *The Church and the City Problem* (1905); *An Observer in the Philippines* (1905); *On the Way to Hwai Yuen* (1905); *The Classic Mediterranean* (1910).

**DEVISE** (same as *device*; OF. Fr. *devise*, from ML. *divisa*, judgment, contrivance, will). Strictly speaking, a testamentary gift of real property. As a verb, the term is frequently, though improperly, employed interchangeably with *bequeath* (properly, to make a legacy, or testamentary gift of personal property), as signifying any disposition of real or personal property by will. The person making the devise is known as the *devisor*, or, more generally, the *testator*; the person to whom the devise is made is called the *devisee*. The power to dispose of one's estate by last will and testament is fully recognized in all systems of law of which we have any record, but the peculiar conditions, due to the feudal system, under which our land law developed created a curious exception to

this general rule in the case of freehold estates in land. While the common law fully recognized the right of testament as applied to personal property of all kinds, including leasehold interests in land, it did not admit the corresponding right of disposing by will of freehold interests.

The invention of the system of uses, whereby lands were conveyed on a passive trust to one man "to the use" and for the benefit of another, opened the door to an evasion of this feudal restriction. The right of the beneficiary of such a trust, called the *cestui que use*, not being a legal estate and so not cognizable by the courts of common law, was protected by the Chancellor as a conscientious claim against the nominal trustee, in whom the bare legal title to the land was vested. The *cestui que use* was thus, by the grace of the Chancellor, permitted to make dispositions of his beneficial interest, as it was termed, which were denied by the common law to the legal tenant of freehold lands, and among them to make deathead or testamentary dispositions thereof. See TRUST, USE.

This practice of devising the use of lands became so common that, upon the abolition of such equitable interests by the Statute of Uses (27 Hen. VIII, c. 1) in 1525, the demand for a convenient and legalized method of disposing of freehold interests in land by testament became irresistible, and resulted five years later in the passing of the first Statute of Wills (32 Hen. VIII, c. 1). This statute was the origin of devises of lands, as we understand the term, and granted "full and free liberty, power, and authority" to dispose by last will and testament in writing of all lands, tenements, and hereditaments, saving only one-third of all lands held by the tenure of knight's service. This restriction was removed by subsequent legislation, and in 1837 a comprehensive statute, the present Wills Act (7 Wm. IV and 1 Vict., c. 26), was enacted, by which all devises of lands in England have since been regulated.

The earliest American statutes were modeled upon the Statute of 32 Hen. VIII, excepting the restriction upon the devising of lands held by knight's service, which, as that tenure never existed on this side of the Atlantic, had no application in this country. Everywhere in the United States freehold interests in lands may now be devised by last will and testament in substantially the same manner as personal property, the matter being regulated by statutes of the several States. See WILL.

Notwithstanding the general assimilation of the process of disposing of lands to that of bequeathing personal property by will, devises retain many of the distinctive characteristics impressed upon them by their origin and early history in chancery. They are subject to peculiar rules of interpretation and they have, under the title of executory devises, contributed a large and important body of doctrine to the law of future estates. See EXECUTORY DEVISE; FUTURE ESTATE; and the authorities referred to under those titles.

**DEVIZES**, də-vī'zez. A municipal borough and market town of Wiltshire, England, near the Avon and Kennet Canal, 22 miles north-northwest of Salisbury (Map: England, E 5). It has two ancient Norman churches and a spacious corn exchange, the town being an important grain market. There are also manu-

factures of tobacco, snuff, silk and farming tools, the formerly important woollen industry having declined. The town owns its gas and water supply. Pop., 1901, 6532; 1911, 6741. Roman household gods and coins have been found here. The name of the town is apparently derived from its Roman name, *Castrum Divisarum* or *Ad Divisas*. Its first charter was granted by Queen Matilda when the town was called *De Vies*. It grew up back of the castle built by Roger, Bishop of Salisbury, in the time of Henry I, on a promontory bordered by two ravines. This castle, which was repeatedly captured during the wars of Stephen and Matilda, and was demolished by Cromwell in 1645, has almost disappeared.

**DEVŌE, dē-vō',** **FREDERICK WILLIAM** (1828-1913). An American manufacturer, born in New York City. After working as a clerk in stores for nine years he became a partner in the firm of Reynolds & Devoe (1852-84) and head of F. W. Devoe & Co. (1864-90), and after 1890 he was president of the F. W. Devoe & C. T. Reynolds Co., manufacturers of paint and varnish. He was at various times president of the New York Board of Education, the Board of Commissioners of Greater New York, and the New York Juvenile Asylum.

**DEVONIAN SYSTEM.** A division of the Paleozoic group of rocks, next above the Silurian and below the Carboniferous; so named from Devon, England, where the strata were early studied and described. The name was suggested by Murchison and Sedgwick to replace that of Old Red Sandstone. It is sometimes called the Age of Fishes on account of the prevalence of these vertebrates in the seas in which the rocks were deposited. The passage of the Silurian into the Devonian is so gradual that the exact boundary between the two systems is rather indefinite. Between the Devonian and the Carboniferous exists a somewhat variable relation; in most parts of North America the two are practically continuous, but in New England and the Acadian provinces a marked unconformity occurs in places, owing to the upturning of the strata at the close of Devonian time. A similar unconformity is represented, also, in parts of Europe. The American section of the Devonian as worked out in the classic New York area is as follows:

Upper	Chemung-Catskill (Sandstones and shales)
	Portage (Shales and sandstones)
	Genesee (Shale)
Middle	Tully (Limestone)
	Hamilton (Shale)
	Marcellus (Shale)
Lower	Onondaga (Mainly limestone)
	Oriskany (Sandstone)
	Helderberg (Mainly limestone)

This classification is now quite generally followed in the United States, although some geologists consider the Helderberg as a part of the Silurian system.

**Conditions in Devonian Time.** At the opening of the Devonian period the North American continent already existed in its present general shape. Several large embayments and troughs indented the coast or extended deeply into the interior, notably the St. Lawrence sea and the Appalachian trough on the northeast, the Gulf embayment on the south, and the Pacific and Arctic embayments on the west and north, and within their basins mainly the strata accumulated. Oscillations of level increased or

diminished these areas of submergence and sedimentation from time to time. During the first part of the Devonian, deposition in the north-eastern waters seems to have proceeded quietly and slowly, resulting in the accumulation of limestones; with Hamilton time the seas became more turbid so that shales accumulated in great thickness. By that time, also, the Gulf embayment had extended itself to the north through the Mississippi region to the Great Lakes and spread eastward so as to connect with the New York basin. The Pacific and Arctic waters likewise reached far inland, and in the Rocky Mountain and Great Basin regions the Hamilton was a time of limestone formation on a great scale. The Upper Devonian was a period of shale and sandstone accumulation chiefly, with a brief interval of limestone in the early part (Tully) and more or less conglomerate in the closing or Chemung stage. A variation of the regular phase of the Chemung strata is presented by the Catskill formation (q.v.), which consists of shales and sandstones that were deposited in fresh and brackish waters.

**Distribution of Individual Formations.** The Helderberg strata are mainly confined to the eastern section of the United States, Nova Scotia, New Brunswick, the Appalachian belt, and the lower Mississippi region. They are mostly limestones which have a thickness of from 300 to 400 feet in eastern New York.

The Oriskany sandstone is developed in central New York and extends thence south along the Appalachians through Pennsylvania, Maryland, and Virginia. It also appears in Ohio, Indiana, southern Illinois, and Missouri. At Oriskany, N. Y., it is 30 feet thick, in Illinois 300 feet. Although sandstone is the prevailing rock, there is some limestone in places.

The Onondaga has a rather widespread distribution, extending from New York to the Mississippi River and being found on James Bay far to the north as a probable continuation of the main area. The limestone is largely made up of corals, sometimes in recognizable reefs, of which a famous example exists at the falls of the Ohio, above Louisville. It is from 100 to 200 feet thick in New York, where it contains strata that are partly made up of chert and are known as the Corniferous limestone.

The Marcellus and Hamilton strata are shales and shaly sandstones, but in the central west include considerable limestone. They extend across New York from east to west and attain a thickness of 1500 feet near the centre of the State. They extend along the Appalachians to Tennessee and are found as far west as Iowa and Missouri; they occur also in the valley of the Mackenzie and in Manitoba, where they represent an accumulation in the Arctic basin which may have reached southward into the United States.

Of the Upper Devonian formations the Tully limestone is a thin band represented in central New York. The Genesee consists of black bituminous shale, 150 feet thick in New York and 300 feet in Pennsylvania. The Portage contains much sandstone and is from 1000 to 1400 feet thick in western New York. The Chemung is still more arenaceous and includes local beds of conglomerate, indicative of very shoal waters; it has a thickness of 1500 feet in the vicinity of Cayuga Lake and of several

thousand feet in Pennsylvania, but thins to the south and west. In eastern New York the Chemung rocks are succeeded by 3000 feet of sandstone and red shales which are separately distinguished by the name "Catskill," as they are thought to have been accumulated under fresh-water conditions.

**Devonian Life.** The life of the Devonian was abundant, but chiefly marine. Sea plants, such as fucoids, continued up from the Silurian, and land plants appeared, including ferns, lycopods, conifers, and equisetæ, many of them being of large size. Some, indeed, are so well preserved that the cellular structure of the wood is observable in their sections. Among the animals great variety abounded. Crinoids of the blastoid or budlike type, also the plumose ones; brachiopods were not lacking, especially the long-winged species; there were also the early forms of ammonites, trilobites, and insects. An important feature is the great abundance of marine vertebrates—fishes, which fairly swarmed in the Devonian seas. They include sharks, cestracanth and hydropont; ganoids, whose modern representative is the gar pike, having the body covered with shining plates of mail, and placoderms, having the body covered with bony plates, such as are worn by the turtle fishes which seem to have linked the ganoids with the sharks. Among the genera were *Cephalaspis* (q.v.), *Pterichthys* (q.v.), *Cocosteus* (q.v.), *Dimichthys* (q.v.). The latter, found in the Ohio Devonian, was at least 18 feet long; another, *Titanichthys*, probably reached 30 feet. Both were covered with heavy plates.

**Economic Products.** The Devonian rocks are of vast importance economically, for they contain the great stores of petroleum and natural gas obtained in Pennsylvania, New York, West Virginia, and other Appalachian States. The pools of oil and gas are mainly found in the sandstones of the Middle and Upper Devonian. The Hamilton, Portage, Chemung, and Catskill sandstones are the familiar bluestone, much used for flagging stones, while the Helderberg and Onondaga yield lime and cement materials.

**Foreign Devonian.** In Great Britain the Devonian system includes sandstones, slates, and limestones similar in general character to those appearing in America. The "Old Red Sandstone," a fresh-water phase of the Devonian in Scotland, admirably described by Hugh Miller, is the British equivalent of the Catskill formation. A large area of Devonian rocks is found in northern France, Belgium, and north Germany, also in Russia, China, and Australia.

**Bibliography.** Dana, *Manual of Geology* (4th ed., New York, 1896); Geikie, *Text-Book of Geology* (London, 1903); Williams, "The Devonian and Carboniferous," *Bulletin* 80, *United States Geological Survey* (Washington, 1891); Chamberlain and Salisbury, *Geology*, vol. ii (New York, 1907); Clarke, "Early Devonian History of New York and Eastern North America," *N. Y. State Museum, Memoir* 9 (in 2 parts, Albany, 1908, 1909); "Devonian," *Maryland Geological Survey Reports* (3 vols., Baltimore, 1913).

**DEVONPORT** (before 1824 called **PLYMOUTH DOCK**). A municipal borough, maritime and fortified town, and naval arsenal of Devonshire, England, situated on a promontory between Stonehousepool and the Hamoaze or

estuary of the Tamar, 2 miles west-north-west of Plymouth (Map: England, B 6). It stands on high ground, with ramparts defended by batteries. The streets are regularly laid out and well paved, and there are a number of handsome public buildings. The town was incorporated in 1837, although its existence dates from the establishment of a dockyard there in 1689 by William III. It sends two members to Parliament. The town maintains electric-light and power stations, gas and water works, bath houses, a fine park, a technical school, and a public library. It is a very important military and naval station, being the seat of the military and naval government of "The Three Towns," i.e., Devonport, Stonehouse, and Plymouth. The institutions include the Naval Engineering College (1880), the municipal technical schools (1890), the naval barracks, and naval and military hospitals. Its dockyard and naval arsenal are among the most important establishments of this kind in the United Kingdom. The dockyard, together with the Keyham Steam Yard farther up the Hamoaze, with which it communicates by a tunnel, covers an area of about 240 acres, its capacity having been about doubled by the addition in 1907 of 118 acres, including 77 acres of mud flats which formerly flooded at high water. Mount Wise is a fine parade ground and contains the residences of the Lieutenant Governor and the Port Admiral. Devonport has important steamship communications. Pop., 1901, 70,437; 1911, 81,694.

**DEVONSHIRE** (AS. *Defena scir*, shire of the Defons). A maritime county, in the south-west peninsula of England, between the Bristol and English channels (Map: England, C 6). Its area is 2604.9 square miles, three-fourths being in pasture or arable. The north coast, 60 miles long, is steep and rocky, the chief indentation being Bideford Bay. The south coast, 100 miles long, is also lined with cliffs and is indented by Tor Bay and Plymouth Sound. The general surface is hilly. The conspicuous feature is Dartmoor (q.v.). Devonshire is an important agricultural and dairy county (about three-fourths of the surface is under cultivation) and has considerable mining, manufacturing, and fishing industries. The chief towns are Exeter (the county town), Plymouth, and Barnstaple. Population of ancient or geographic county, 1901, 661,314; 1911, 701,944; of administrative county, 1901, 436,938; 1911, 457,343.

**DEVONSHIRE, SPENCER COMPTON CAVENDISH**, eighth DUKE OF (1833-1908). An English statesman, long and familiarly known as the Marquis of Hartington. He was the eldest son of William, the seventh Duke, and was born in London, July 23, 1833. He graduated at Trinity College, Cambridge, 1854; was attached to Earl Granville's special mission to Russia, 1856, and entered Parliament as a Liberal, 1857. In 1859 he moved the vote of want of confidence that resulted in the fall of the Derby ministry. He became Lord of the Admiralty and Undersecretary for War in 1863 and was Secretary for War for a brief period in 1866. He held the office of Postmaster-General in Mr. Gladstone's cabinet, 1868-71, resigning in the latter year to become Chief Secretary for Ireland. In 1875 he succeeded Mr. Gladstone as the leader of the Opposition in Parliament, and on the downfall of the Conservative administration, 1880, was sent for by the Queen to form the new cabinet; this task being declined both by him and by Lord Gran-

ville, it finally devolved upon Mr. Gladstone. In the new cabinet Lord Hartington was first Secretary of State for India and then Secretary of State for War (1883-85), during which period occurred Lord Wolseley's memorable expedition to relieve General Gordon (q.v.) at Khartum. Opposed to Mr. Gladstone's Home Rule policy, in 1886 he became the acknowledged leader of the Liberal Unionists (q.v.), and subsequently gave a vigorous support to Lord Salisbury's administration. He became eighth Duke of Devonshire in 1891, and the following year married the Dowager Duchess of Manchester, widow of the seventh Duke. The same year he received the order of the Garter. From 1895 to 1903 he was Lord President of the Council and from 1900 to 1902 President of the new Board of Education. He retired from the ministry in 1903 as a protest against the protectionist views advocated by Mr. Joseph Chamberlain and became president of the Unionist Free Food League. He received the academic honors of the lord rectorship of Glasgow University, 1877, lord rectorship of Edinburgh University, 1879-81, the chancellorship of Cambridge University, 1892, and presidency of Owens College, Manchester, 1900.

**DEVONSHIRE CLUB.** A Liberal club, founded in 1875, on St. James's Street, London.

**DEVONSHIRE HOUSE.** The London residence of the dukes of Devonshire, in Piccadilly, near Berkeley Square. It contains fine collections of portraits, gems, and the "Kemble Plays," including the first editions of Shakespeare.

**DEVRIENT, de vřent.** See FLORIS, FRANS.

**DEVRIENT, de-vřyřř,** GUSTAV EMIL (1803-72). One of a distinguished German family of actors, he and his elder brothers, Karl August (1797-1872) and Philipp Eduard (q.v.), being nephews of Ludwig Devrient (q.v.). Emil Devrient, as he is known, was born Sept. 4, 1803, in Dresden, and began life in a manufacturing business, but, having the family preference for the theatre, made his debut as an actor and singer in Brunswick in 1821, as Raoul in Schiller's *Jungfrau von Orléans*. In 1825, in Leipzig, whither he had come about two years before from Bremen, he married Dorothea Böhler, a popular actress. After playing also in Magdeburg (1828) and Hamburg (1829), he, in 1831, began his connection with the Court Theatre of Dresden, where he spent most of the remainder of his life. He died Aug. 7, 1872. He was an artist of great ability, excelling notably in the use of his voice. When he played Hamlet in London, his performance was considered equal to that of either Kean or Kemble. Among his greatest rôles were Hamlet, Posa, Tasso, and Uriel Acosta.

**DEVRIENT, LUDWIG** (1784-1832). A celebrated German actor, first of the noted theatrical family of this name. He was born Dec. 15, 1784, in Berlin, the son of a silk merchant, and had begun the commercial career that his father planned for him, when, in 1804, he joined a traveling dramatic company. He made his debut in Gera, as the messenger in Schiller's *Braut von Messina*. The next year he secured an engagement in Dessau, and in 1809 he went to Breslau. In 1815, having made the acquaintance of Iffland (q.v.), he appeared for the first time on the stage in Berlin, as Franz Moor in Schiller's *Räuber*. He won distinction also in the rôles of Talbot, Schewa, Lorenz Kindlein, the Moor in *Fiesco*, and the Shakespearean parts of Shylock,

Lear, Richard III, and Mercutio. His acting was characterized by great originality, and he excelled alike in pathos and humor. His power was due more, it is said, to his natural gifts than to study. His habits of life were dissipated, and his premature death, which occurred in Berlin, Dec. 30, 1832, was hastened by the use of stimulants. Consult Funck, *Aus dem Leben zweier Schauspieler, Ifflands und Devrient's* (Leipzig, 1838).

**DEVRIENT, OTTO** (1838-94). A German actor and dramatist, son of Philipp Eduard Devrient (q.v.). He was born Oct. 3, 1838, in Berlin, and made his debut on the stage in Karlsruhe in 1856. He had engagements in Stuttgart, Berlin, and Leipzig; then returned to Karlsruhe in 1863 and remained till 1873, after which he was manager successively of theatres in Weimar, Mannheim, and Frankfurt. In 1879 he retired to Jena and there produced his *Luther*, a play written on the occasion of the Luther jubilee in 1883. The next year he became director of the Court Theatre in Oldenburg and in 1889 was called to a similar position in Berlin, from which he retired in 1890. He died June 23, 1894. He is the author of several dramas, among them *Zwei Könige* (1867), *Tiberius Gracchus* (1871), and *Kaiser Rothbar* (1873); and other works, including *Zwei Shakespeare-Vorträge* (1869); and an edition of letters of Iffland and Schröder (1881).

**DEVRIENT, PHILIPP EDUARD** (1801-77). A German actor and dramatist, brother of Karl August and Gustav Emil Devrient (q.v.). He made his debut as an opera singer in Berlin when 18 years old, but after 1835 devoted himself to the drama and was manager for a time of the Dresden Theatre. From 1852 to 1870 he directed that of Karlsruhe. He wrote a number of dramatic pieces, among them the libretto for the opera *Hans Heiling* (1827), and the plays *Das graue Männlein*, *Die Gunst des Augenblicks* (1833), *Die Verrückungen* (1837), and *Treue Liebe* (1841); and also several historical and critical works upon the drama, notably his *Geschichte der deutschen Schauspielkunst* (1848-74).

**DE VRIES, de vřřs, DAVID PIETERZEN.** A Dutch colonist. Nothing is known of his early history except that he served for a time as master artilleryman in the Dutch army. He was a member of an association or company which was organized in 1630 for the purpose of settling the tract of land in the present State of Delaware bought from the Dutch West India Company by Samuel Blommaert and Samuel Godyn in the previous year. A small settlement was made early in 1631, on Lewes Creek, just within Cape Henlopen, and the surrounding country was christened Swaanendael. In a few months, however, the colony was destroyed by the Indians, and De Vries, who had been chosen governor or director, found on his arrival (1632), says Bancroft, "only the ruins of the house and its palisades, half consumed by fire, and here and there the bones of colonists." He left a portion of his party there, while he himself spent some time in Virginia; but concluding that the colony would never be a commercial success, he carried the colonists back to Holland in 1634. He visited Manhattan several times thereafter; attempted to establish a patroonship on Staten Island, where in 1640 his settlement was destroyed by the Indians; and for some time lived on a plantation, Vriessendael, about 25 miles

north of New Amsterdam, on the site of the present Tappan, N. Y. He published a volume entitled *Korte historiaal ende Journaels Aenteykeninge van verscheyden Voyagien in der vier Teelen des Wereldts Ronde* (1655) ('A Short History and Notes of a Journal Kept during Several Voyages in the Four Quarters of the World'), which contains a valuable account of conditions in New Netherland during the administration of Van Twiller and Kieft. The parts of it relating to America have been translated into English and may be found in vols. i and iii, 2d series, of the *Collections of the New York Historical Society*.

**DE VRIES, HUGO** (1848- ). A Dutch botanist, born at Haarlem and educated at Leyden, Heidelberg, and Würzburg, and after 1871 connected with the University of Amsterdam, first as lecturer and then as professor of botany. His great work was done in connection with the development of the theory of mutation (q.v.) as a method of evolution. It is the best-known explanation of organic evolution since Darwin's theory of natural selection. The most important contribution of De Vries to science is probably the changing of the method of studying evolution from observation to experimental work. Among his numerous publications the following are the best known: *Intracellular Pangenesis* (1889); *Die Mutationstheorie* (1901-03); *Plant Breeding* (Chicago, 1907).

**DE VRIES, MARION** (1805- ). An American lawyer and public official, born near Woodbridge, San Joaquin Co., Cal. In 1886 he graduated from San Joaquin Valley College and in 1888 from the Law School of the University of Michigan. He settled in Stockton, Cal., was assistant district attorney of San Joaquin County (1893-97), was admitted to practice before the Supreme Court of the United States in 1897, and from that year until 1900 served as a member of the United States House of Representatives. He was appointed to the Board of United States General Appraisers, New York, in 1900, and of this board was president from 1906 to 1910. In the latter year he received an appointment as associate judge of the United States Court of Customs Appeals.

**DEW** (AS. *dēaw*, Ger. *Thau*; cf. Skt. *dhav*, *dhas*, to flow). Dew is said to be formed when atmospheric moisture is condensed by cold into drops of water upon grass, trees, rocks, roofs of buildings, or other solid surfaces, while the adjacent air remains clear. The moisture which gathers on the outside of a vessel containing cold water is also termed dew. A thermometer placed in the cold water within this vessel so as to give the temperature of the external surface when that is just cold enough to cause the dew to deposit, indicates the so-called temperature of the dew point, or the temperature to which the free air must be cooled in order to begin depositing dew, and this combination of thermometer and vessel is a *dew-point apparatus*. Many forms of such apparatus have been devised in order to secure accuracy in the use of this method for the measurement of atmospheric moisture and are described in Abbe's *Meteorological Apparatus and Methods* (Washington, 1888). The apparatus usually preferred is that of Regnault, which, with occasional slight modifications, is used in many fundamental determinations of temperature of the dew point. This apparatus consists essentially of a very sensitive thermometer, whose bulb dips into a

thimble of polished gold or silver, while the upper end of the graduated stem protrudes beyond this thimble. If the thimble is filled with ether and a current of air blown through it in order to evaporate the ether, the latter soon cools down to the dew point. When this is reached, a slight deposit of dew is seen on the outside of the polished thimble. At this moment the reading of the thermometer is to be noted, and as the temperature of the ether has probably already fallen below the dew point, one waits a minute until the dew on the polished tube evaporates and disappears, when another reading of the thermometer is made. The mean of these two readings should give the temperature of the dew point. By a skillful manipulation of the apparatus the dew appears and disappears with a scarcely appreciable variation in the reading of the thermometer.

When dew is thus deposited, it indicates that the air from which the moisture comes has been cooled to what is known as the point of saturation and all the vapor associated with the air can no longer remain as vapor. This cooling process takes place naturally every clear night, so that in the course of the early morning not only are the grass and other exposed objects often covered with dew, but the quiet layers of the air near the ground begin to condense their moisture in the shape of fog. The deposition of dew, and especially the formation of fog, retards the cooling of leaves and other objects near the ground and delays the occurrence of freezing temperatures and frosts. The actual quantity of dew accumulating on the leaves and dripping to the ground, so as to become available for the use of the roots of the plants, is in cloudless regions, such as Arizona, California, Syria, and Arabia, so large as to be an important matter in agriculture. Many attempts have been made to devise apparatus for measuring the absolute quantity of dew per unit of area of surface, but these drosometers (q.v.) almost necessarily employ as the collecting surface something different from the natural leaves, grass, and stones, and their measurements are at best not absolutely, but only relatively, representative of the natural phenomenon.

The discovery of the true explanation of the formation of dew is commonly ascribed to Dr. W. C. Wells, of Charleston, S. C., and London, England, who published his *Essay on Dew* in 1814, but is equally due to Muschenbroek, Feclat, Wilson, and others. The air that lies near the surface of the ground receives its moisture to a considerable extent from the soil beneath it, and therefore only a small part of the dew comes from a great distance. The ground is perpetually either absorbing or giving out moisture, and the nearer the bedewed surface is to the ground the more of this fresh moisture it will contain, so that the idea that dew falls from above, whence its Spanish name, *serena*, and its French name, *serain*, is not correct, as was shown by Muschenbroek and Wells and very recently restated by Stockbridge. The formation of dew and fog in the night can only take place when (and therefore indicates that) the sky is sufficiently cloudless to allow of almost uninterrupted radiation of heat. Consequently, when any object is covered by even the slightest screen, no dew is found on it.

If the dew point is below the temperature of freezing, then, instead of dew, we have a formation of frost. When the wind is blowing, dew is

not formed except in damp weather. In dry weather the wind brings a supply of relatively warm, dry air to the cooling surfaces of the leaves and prevents them from cooling to the dew point.

When the air is exceedingly dry, the process of radiation (counteracted, as it always is, in part by the conduction and convection of heat) may not be sufficiently intense or proceed far enough to cool ordinary surfaces down to the dew point: temperatures will, of course, steadily fall during the night, but a stationary temperature may be reached above the dew point that represents the balance between the heat losses by radiation and the gains by conduction from the relatively warmer surrounding air. Moreover, the sun may rise and warm up the ground before the dew-point temperature is passed. This can occur only in dry air, viz., that in which the dew point is very low. Under the most favorable conditions in the dry climate of Arizona the temperature at the surface may thus be lowered in the course of a night by as much as 20, 30, or 40 degrees, when the depression of the dew point below the temperature of the dry air is still greater, so that on such a night no dew is recorded.

The number of degrees by which the dew point is lower than the temperature of the air is known as the *complement of the dew point*. In addition to the dew-point apparatus there are other indirect methods of determining the dew point, which are less exact, but frequently more convenient. The apparatus most commonly used in such cases is the so-called dry and wet bulb thermometer, or psychrometer, which will be found described under *HYGROMETER*.

For many details with regard to dew and cognate phenomena, consult the works of Charles Tomlinson, especially *The Dewdrop and the Mist* (London, 1860), and his historical article in the *Edinburgh New Philosophical Journal*, vol. xiii (Edinburgh, 1861).

**DEW, THOMAS RODERICK** (1802-46). An American educator and writer. He was born in King and Queen Co., Va., and graduated in 1820 at William and Mary College, where he was professor of history, metaphysics, and political economy from 1827 to 1836 and served as president from 1836 until his death. In 1832 he published a review of the celebrated debate of 1831-32 over slavery in the Virginia Legislature, under the title *An Essay in Favor of Slavery*, which went far towards putting a stop to a movement, then assuming considerable proportions, to proclaim emancipation in Virginia. His most important work is a *Digest of the Laws, Customs, Manners, and Institutions of Ancient and Modern Nations* (1853).

**DEWALQUE, de-vâlk', GILLES JOSEPH GUSTAVE** (1826-1905). A Belgian geologist, born at Stavelot. He became curator of the mineralogical and geological cabinet at the University of Liège in 1855, and professor there of mineralogy, geology, and paleontology in 1857. In 1870 he was elected president of the Belgian Academy. In addition to a considerable number of contributions to scientific periodicals, he has published a *Description du Lias dans le Luxembourg* (1857), an *Atlas de cristallographie* (1860), *Prodrome d'une description géologique de la Belgique* (2d ed., 1880), and other works.

**DEWAR, SIR JAMES** (1842- ). A British chemist, born at Kincardine-on-Forth, Scotland. He was educated at Edinburgh Univer-

sity and was assistant there to Lord Playfair when he occupied the chair of chemistry. Subsequently he became Jacksonian professor of experimental philosophy at Cambridge and Fulmerian professor of chemistry in the Royal Institution. In 1897 he was elected president of the Chemical Society and in 1902 of the British Association. He received the degrees of LL.D. and D.Sc. from various universities, was chosen to honorary membership in many foreign societies, and in 1904 was knighted. His scientific researches include studies in regard to the physiological action of light and the liquefaction of gases and in particular investigations of low temperatures. By means of the evaporation of liquid hydrogen under a reduced atmospheric pressure he obtained the lowest temperature yet reached (13° absolute; 470° F. of frost). With Sir Frederick Abel (q.v.) he invented cordite, a smokeless gunpowder used by the British government, and he also introduced vacuum flasks (commonly known as thermos flasks) for keeping foods cold or hot for long periods.

**DEWART, EDWARD HARTLEY** (1828-1903). A Canadian clergyman and author, born in County Cavan, Ireland. In 1834 he was brought to Canada by his parents, who settled in Peterborough Co., Ontario. He was educated mainly at the Normal School, Toronto, and in 1855 was ordained a Wesleyan Methodist minister. After a number of successful pastorates he was elected editor of the *Christian Guardian*, the chief organ of Canadian Methodism, and held that position until 1894. His editorship was forceful and of marked controversial ability. The first step towards the union of the various Methodist denominations in Canada (Wesleyan Methodist, Methodist Episcopal, New Connexion, Bible Christian, and Primitive Methodist) was taken at a private meeting in his house. After union was accomplished in 1883, though not on the basis acceptable to him, he loyally strove to make it a success. He took a foremost part in the federation of Victoria University (Methodist) with the provincial University of Toronto. A Liberal in politics, he did not hesitate to vote accordingly, and excited strong prejudice by his support of a Roman Catholic candidate for Parliament. In 1898 he was an unsuccessful candidate for the Ontario Legislature. Twice he was a delegate to Ecumenical Methodist conferences—once in London in 1881 and once in Washington in 1891. He favored prohibition of the liquor traffic. Though not narrowly orthodox in theology, in the latter part of his editorship he took strong ground against the tenets of the higher criticism. He had a leading share in compiling and editing a new hymn book for the Methodist church. His poetic gift was proved by his *Songs of Life* (1869), a volume of original verse; and he also published a volume of *Meditations from the Canadian Poets* (1864). Among his other works are: *Jesus, the Messiah* (1892); *Essays for the Times* (1898); *Outlines of Christian Doctrine* (1899).

**DEWBERRY** (from *dew* + *berry*, apparently as being a trailing plant), *Rubus canadensis* or *Rubus villosus*. A representative of the blackberry tribe, familiarly known as running brier, and recognized as a common weed of worn-out or neglected fields and waste places. It is also known as the running blackberry. There are several species of *Rubus* which have

a decumbent habit, but the above is the only one which has given a cultural product of merit. The cultivation of this form of blackberry began with the discovery and introduction of the *Lucretia*, a large-fruited and strong-growing form which has given good returns under skillful management. It is usually planted 3 × 6 feet apart, given clean culture, and the vines tied to stakes or provided with a rack or trellis. It propagates readily by layers. Hybrids between the blackberry and dewberry are in cultivation and are not uncommon in nature. See also RUBUS.

**DEWDNEY, EDGAR** (1835- ). A Canadian civil engineer and statesman. He was born in Devonshire, England, and was educated as a civil engineer. In 1859 he went to British Columbia, surveyed the site and laid out the town of New Westminster, and afterward in his professional capacity explored many parts of the province, then little known, at the same time superintending the construction of important public works. He was elected a Conservative member of the Provincial Legislature (1868), was a member of the Dominion House of Commons (1872-79), was Indian Commissioner of the Northwest Territory (1879-81), and Lieutenant Governor of the same (1881-88). In 1888 and 1892 he was again elected to the Dominion Parliament and appointed Minister of the Interior in the cabinet of Sir John A. Macdonald. In 1892-97 he was Lieutenant Governor of British Columbia, after which he resumed business life.

**DEWEES, WILLIAM POTTS** (1768-1841). An American physician and obstetrician, born at Pottsgrove, Pa. Adjunct professor from 1826, in 1834 he became professor of obstetrics and the diseases of women and children in the University of Pennsylvania, but resigned in the same year. Among his publications are: *System of Midwifery* (1826, 12th ed., 1854); *Treatise on the Physical and Medical Treatment of Children* (1825; 10th ed., 1854); *Treatise on the Diseases of Females* (1826; 10th ed., 1853); *Practice of Medicine* (1830).

**DEWES, dñz, SIR SIMONDS** (1602-50). An industrious English chronicler and antiquarian. He was the son of Paul D'Ewes, of Milden, Suffolk, one of the six clerks of chancery, and was born at Coxden, Dorsetshire, on Dec. 18, 1602. His preparatory education was gained under several private teachers. Through Henry Reynolds, of St. Mary Axe Parish, London, he became strongly indoctrinated with the Puritan theology, and to John Dickinson, upper master of Bury School, he owed his first enthusiasm for scholarly research. In 1618 he entered St. John's College, Cambridge; but two years later, before taking a degree, he was removed by his father to the Inner Temple, where he was called to the bar in 1623. He abandoned the law three years later, partly in consequence of his marriage with the rich heiress of Sir William Clifton, of Lutons Hall, Suffolk. In the same year he was knighted. He now began to devote himself zealously to those antiquarian studies which he never abandoned, although he represented Sudbury in the Long Parliament and was one of the members expelled by Pride's Purge in 1648. He wrote and collected a vast number of manuscripts and made many transcripts from monastic and other records, and these now form a part of the Harleian collection preserved in the British Museum. His greatest work is the

*Journal of All the Parliaments of the Reign of Queen Elizabeth*, finished in 1629, but first edited and published by his nephew, Paul Bower (London, 1682). This work was incorporated by Cobbett in his *Parliamentary History*. Consult: Jessopp, in the *Dictionary of National Biography*, vol. xiv (London, 1888), and Halliwell-Phillipps's edition of the *Autobiography and Correspondence of Sir Simonds D'Ewes during the Reign of James I and Charles I* (London, 1845).

**DE WET, de vêt', CHRISTIAN RUDOLPH** (1854- ). A distinguished Boer commander and statesman. He won a name for gallantry in the war between the Transvaal and the British in 1880-81 and became famous for his skill in hunting. In 1897, he was a member of the Orange Free State Volksraad. During the latter stages of the Boer War of 1899-1902 he proved a formidable adversary to the British who for a time made him their principal objective. Frequently he would appear to be completely enmeshed in a girdle of blockhouses, wire entanglements and fences, and pursuing columns, but as often, through the exercise of a clever ruse, completely evaded his pursuers and inflicted damage on some British convoy or outpost in the most unexpected direction. On Feb. 6, 1902, his capture between Lindley and Kroonstad, by the British columns under Lord Kitchener, seemed certain. He was driven into a corner from which escape was rendered difficult by strong wire fences and entanglements; but, to the consternation of his pursuers, he hurled a large drove of cattle, goaded almost to madness, against the wire obstacles, and in the confusion made his escape. In common with other Boer leaders, he made submission to Lord Kitchener and afterward served on a Boer committee to raise funds in Europe and America for the distressed Boer families. During the war he never wore the slightest badge of rank, and he was always taciturn to a degree. He had the complete confidence of his soldiers, but, in common with all the other Boer leaders, suffered the defeat of his best schemes because of the individuality and independence of the burghers under his command. He was regarded by the British government as one of the most influential of the Boer leaders, and great satisfaction was evinced at the dignified manner of his acceptance of the inevitable. He wrote *Three Years' War* (New York, 1902). After 1907 he was a member of the new Parliament of the Orange Free State and also Minister of Agriculture. In the Closer Union Convention of 1908-09 he was a delegate. In 1912 he was appointed to the South African Council of Defense.

**DE WETTE, de wët'te or vêt'e, WILHELM MARTIN LEBERRECHT** (1780-1849). A German theologian. He was born at Ulla, near Weimar, and studied at the University of Jena. In 1807 he was appointed extraordinary professor of philosophy at Heidelberg, in 1809 professor of theology, and in 1810 was called to Berlin. By his excellence as a teacher, as also by his writings, De Wette soon acquired a great reputation. In 1819, on account of a friendly letter which he wrote to the mother of the assassin of Kotzebue, he was deprived of his chair. In 1822 he was appointed professor of theology in the University of Basel, where his prelections and sermons in a short time secured him universal esteem and applause. In 1829 the Grand Council

of Basel made him a member of the Council of Education and granted him the freedom of the city. In 1849 he was elected rector of the university, but died the same year. De Wette was a man of comprehensive learning and acute philosophic discernment. His antipathy to the shackles of dogmatic theology gave keenness and vigor to his criticism. He is one of the forerunners of the modern study of the Bible. A temperate but very decided historical rationalism, on a broad basis of moral reverence, would perhaps best express his biblical standpoint. His principal works are: *Beiträge zur Einleitung in das alte Testament* (1806-07); *Commentar über die Psalmen* (1811); *Lehrbuch der historisch-kritischen Einleitung in die Bibel, alten und neuen Testaments* (1817-26; Eng. trans. of Old Testament part by Theodore Parker, 1843); *Lehrbuch der christlichen Dogmatik* (1813-16); *Christliche Sittenlehre* (Eng. trans. by Samuel Osgood, 1842); *Theodor* (1828; Eng. trans. by James Freeman Clarke, 1849); *Vorlesungen über die Religion, ihr Wesen, und ihre Erscheinungsformen* (1827); *Das Wesen des christlichen Glaubens* (1846); *Exegetisches Handbuch zum neuen Testament* (1836-48). With J. C. W. Augusti he made a German translation of the entire Bible (Heidelberg, 1809-11, 5 parts; 4th ed., 1858, 3 vols.). Besides these, De Wette published a critical edition of the correspondence of Luther (Berlin, 1825-28). For his life, consult A. F. J. Wiegand (Erfurt, 1879). For an estimate of his biblical work, consult Cheyne, *Founders of Old Testament Criticism* (London, 1894).

**DEWEY, CHARLES MELVILLE** (1849- ). An American landscape painter. He was born at Lowville, N. Y. Confined to his bed from his twelfth to his seventeenth year by a hip disease, he formed the poetic conception of nature which appears in his pictures. He studied in the schools of the National Academy of Design, New York (1874-76), and in Paris under Carolus-Duran, whom he assisted to paint a ceiling in the Louvre. In 1878 he returned to New York. Dewey's work is full of a highly individual, poetic sentiment and generally depicts subdued morning and evening effects. His landscapes in oil and water color are in many public galleries and private collections of the United States. Among the best are: "Indian Summer" and "A November Evening" (1904); "Morning Bay of St. Ives" and "The Brook" (1905); "The Edge of the Forest" (Corcoran Gallery, Washington); "The Harvest Moon" and "The Close of Day" (National Gallery, Washington); "The Gray Robe of Twilight" (Buffalo Gallery); and "Old Fields" (Pennsylvania Academy, Philadelphia). He was made a member of the National Academy of Design in 1907.

**DEWEY, CHESTER** (1784-1867). An American scientist. He was born in Sheffield, Mass., and, graduating from Williams College in 1806, was professor of mathematics and natural philosophy there from 1810 to 1827. From 1850 until 1860 he was professor of chemistry and natural philosophy in the University of Rochester. Dr. Dewey made many contributions to science.

**DEWEY, DAVIS RICH** (1858- ). An American economist and statistician, born at Burlington, Vt., and educated at the University of Vermont and Johns Hopkins University. He became professor of economics and statistics

at the Massachusetts Institute of Technology and secretary of the American Statistical Association, Boston, Mass. He was a member of the commission on public charitable and reformatory institutions in 1897, and of the State board on the question of the unemployed. He was special expert agent on wages for the twelfth United States census (1902), secretary of the American Statistical Association (1886-1906), president of the American Economic Association (1909), and became managing editor of the *American Economic Review* in 1911. He wrote: *Syllabus on Political History since 1815* (1887); *Financial History of the United States* (1902; 4th ed., 1912); *Employment and Wages: Special Report of the Twelfth Census* (1903); *National Problems* (1907). He was a contributor to the first edition of the NEW INTERNATIONAL ENCYCLOPEDIA.

**DEWEY, GEORGE** (1837- ). An American naval officer, born in Montpelier, Vt. He graduated at the United States Naval Academy in 1858 and began active service on the Mediterranean station. In 1862, under Farragut, he was present at the passage of Forts Jackson and St. Philip on the lower Mississippi and in 1864-65 participated in the attack on Fort Fisher. He became lieutenant commander in 1865, commander in 1872, captain in 1884, and commodore in 1896. In 1898, at the outbreak of the war with Spain, he was appointed to the command of the Asiatic station and on May 1 entirely destroyed the Spanish fleet in Manila Bay without the loss of a man in his own fleet. In recognition of this achievement he was immediately appointed rear admiral and was especially honored by Congress. He aided General Merritt in the capture of the city of Manila (Aug. 13, 1898) and subsequently was a member of the Schurman Philippine Commission. His reception in the United States on his return in 1899 was an enthusiastic ovation. The same year he was made admiral of the navy and is the only officer who has ever held that rank, Farragut and Porter having been admirals but not "admirals of the navy." Admiral Dewey has served on the Lighthouse Board, as Chief of the Bureau of Equipment, and as President of the Board of Inspection and Survey. In the months preceding the presidential campaign of 1900 his name was prominently before the country for a time, but his candidacy from a political standpoint was not seriously considered. In 1901 Admiral Dewey served as president of the Schley Court of Inquiry. (See SCHLEY.) He signed the unanimous report delivered by the court to the Secretary of the Navy on December 13, but further submitted a minority report in which he dissented from certain specifications of the principal document.

**DEWEY, JOHN** (1859- ). An American philosopher, psychologist, and educator, born in Burlington, Vt. He graduated in 1879 at the University of Vermont and in 1884 received a Ph.D. from Johns Hopkins. He was professor of philosophy at the universities of Minnesota (1888-89), Michigan (1889-94), and Chicago, where he was also director of the School of Education (1894-1904), and in 1904 he was appointed professor of philosophy in Columbia University. The degree of LL.D. was conferred on him by the universities of Wisconsin and Vermont. Dewey became actively interested in the reform of educational theory and practice,

and while at the University of Chicago he put his educational principles to the test in the University High School. Among his philosophical colleagues he stands with William James as one of the two great American leaders of the pragmatic movement, although with his aversion to scholastic labels he is reluctant to call himself a pragmatist. (See PRAGMATISM.) His first original work in philosophy was in the field of ethics, and then he turned to logic, applying there the methods that he had worked out in the study of morality. Just as in morality new situations call for new ideals, so in thought, he maintains, new meanings are given to old categories by the new uses to which they are put in dealing with new problems. "If we put ourselves in the attitude of a scientific inquirer in asking what is the meaning of truth *per se*, there spring up before us those ideas which are actively employed in the mastery of new fields, in the organization of new materials. This is the essential difference between truth and dogma, between the living and the dead and decaying. Above all, it is in the region of moral truth that this perception stands out." Ideas are plans of action, and "truth means the effective capacity of the idea 'to make good.'" Dewey's logic is thus instrumentalistic (see INSTRUMENTALISM), and it is connected with the theory that reality is experience, that everything is what it is experienced as being. This view he calls "immediate empiricism." (See EMPIRICISM.)

Dewey's publications include: *Outlines of a Critical Theory of Ethics* (1881); *Study of Ethics* (1894); *The Significance of the Problem of Knowledge* (1897); *My Pedagogical Creed* (1897); *The School and Society* (1900); *Studies in Logical Theory* (1903); *Ethics*, in collaboration with Tufts (1908); *How We Think* (1909); *Influence of Darwin on Philosophy and Other Essays* (1910); *Interest and Effort in Education* (1913). Consult: James, *Pragmatism* (1907) and *The Meaning of Truth* (1909); DeLaguna, *Dogmatism and Evolution* (1910); Moore, *Pragmatism and its Critics* (1910); and recent volumes of the *Philosophical Review* and the *Journal of Philosophy, Psychology, and Scientific Methods*, where his views have been assailed and defended by many writers.

**DEWEY, LISTER HOXIE** (1865- ). An American botanist, born at Cambridge, Mich. In 1888 he graduated from Michigan Agricultural College, where for the next two years he taught botany. He was an assistant botanist of the United States Department of Agriculture from 1890 to 1902 and thereafter botanist in charge of fibre investigations. In 1911 he was the representative of the United States to the International Fibre Congress at Soerabaya, Java. His publications comprise bulletins of the United States Department of Agriculture on the production of fibre from flax, hemp, sisal, and manila plants, on the classification and origin of the varieties of cotton, and also investigations on grasses and troublesome weeds.

**DEWEY, MELVIN** (1851- ). A pioneer American librarian and educator. He was born at Adams Centre, N. Y., and graduated at Amherst College in 1874. In 1876 he published his *Decimal Classification* (7th ed., 1911, as *Decimal Classification and Relative Index*), and founded the *Library Journal*, the organ of American librarians. He took an active part

in founding the American Library Association, of which he was secretary for 15 years and twice president. At this period he also edited the *Spelling-Reform Bulletin*, the *Metric Bulletin*, and similar educational publications. From 1883 to 1888 he was librarian of Columbia College, where he established (1884) a school of library economy. This was transferred to Albany in 1890 as the State Library School, Dewey remaining director until 1906. He was from 1888 to 1900 secretary and executive officer of the University of the State of New York, from 1888 to 1906 director of the New York State Library, and in 1904-06 also State director of libraries. He prepared cataloguing rules that are widely used; his "decimal classification" has been adopted in most American and in many foreign libraries. He contributed to the first edition of the *NEW INTERNATIONAL ENCYCLOPEDIA*.

**DEWEY, ORVILLE** (1794-1882). An American Unitarian clergyman. He was born in Sheffield, Mass., graduated at Williams College, and later became a divinity student at Andover. He preached in Boston for two years, as assistant to Dr. Channing. In 1823 he became pastor of the Unitarian Church in New Bedford. He went to New York in 1835 and there secured the erection of the church of the Messiah. About 1844 he quitted the pulpit and lectured in various parts of the country. Among his works are: *Letters on Revivals*; *Discourses on Human Nature*; *Discourses on Human Life* (1841); *Discourses on the Nature of Religion*; *The Unitarian Belief*; *The Problem of Human Destiny* (Lowell lectures, 1864). A collected edition of his works appeared in New York (3 vols., 1848-52). Consult his *Autobiography and Letters*, ed. by his daughter (Boston, 1883).

**DEWEY, RICHARD (SMITH)** (1845- ). An American alienist and neurologist, born at Forestville, N. Y. He graduated (M.D.) from the University of Michigan in 1869 and in 1870-71, during the Franco-Prussian War, was volunteer assistant surgeon at the field hospital at Pont à Mousson, France, and at the Reserve Hospital at Hesse-Cassel, Germany. Part of 1871 he spent in study under Virchow at Berlin. He was assistant physician at the State Hospital for the Insane at Elgin, Ill. (1872-79), medical superintendent of the State Hospital for the Insane at Kankakee, Ill. (1879-93), professor of mental and nervous diseases at the Chicago Postgraduate Medical School (1893-1909), and after 1895 head of the Milwaukee Sanitarium. In 1896 he was president of the Medico-Psychological Society. He is a contributor on mental diseases to medical journals.

**DEWEYLITE**. A hydrated magnesian silicate, related to serpentine. It is amorphous and ranges in color through shades of white, yellow, red, and brown. Deweyite was named from Prof. Chester Dewey, an American chemist and naturalist.

**DEWI, SAINT**. See DAVID, SAINT.

**DE WINDT, HARRY** (1856- ). An English explorer, born in Paris and educated at Magdalene College, Cambridge. In 1876-78 he was aid-de-camp to Rajah Brooke, of Sarawak, who had married De Windt's sister. Among his journeys were one to the prisons of western Siberia in 1890, another to those of eastern Siberia in 1894, one to the Klondike in 1897, and trips through the Sahara and Morocco in

1911-13. He wrote: *On the Equator* (1882); *From Peking to Calais by Land* (1887), a record of his ride across the two continents; *A Ride to India* (1890), describing a trip from Russia via Persia; *Siberia as It Is* (1892); *The New Siberia* (1895); *Through the Gold Fields of Alaska to Bering Straits* (1898); *True Tales of Travel and Adventure* (1879); *Finland as It Is* (1901); *From Paris to New York by Land* (1903), an account of his travels in 1896 for *Pall Mall Gazette*; *Through Savage Europe* (1907), a tour of the Balkan states for the *London Daily Express*; *My Restless Life* (1908); and some poems and novels.

**DEWING, THOMAS WILMER** (1851- ). An American figure and portrait painter. He was born in Boston, May 4, 1851, and studied in Paris under Boulanger and Lefebvre from 1876 to 1879. His canvases are small in size, delicate and subtly refined in conception and treatment, soft and evanescent in color, and full of poetic charm. Among his best paintings are: "The Days" (Clark prize, 1887); "The Lady in Yellow"; "The Lady in White"; "The Letter" (Metropolitan Museum, New York); "The Recitation" and "The Lady in Green and Gray" (Art Institute, Chicago); "Summer" (National Gallery, Washington); and 20 paintings in the Freer collection (Detroit), including "A Lute Player" and "A Musician." On the death of the owner these will pass to the National Gallery. He was a member of the Society of American Artists, was elected to the National Academy of Design in 1888, and received many medals.—His wife, MARIE OAKLEY DEWING (1857- ), paints still life, especially flowers, with a delicacy and refinement reminiscent of her husband's figure pieces.

**DE WINTER, de winter, JAN WILLEM** (1750-1812). A Dutch admiral. He was born at Kampen and entered the navy at the age of 12. He fought in the French ranks under Dumouriez and Pichegru, rising to the rank of brigadier general. Upon his return to Holland in 1795 he became commander of the Dutch fleet, consisting of 15 ships of the line and 12 frigates. On Oct. 11, 1797, he was attacked by a British fleet under Admiral Duncan and defeated in the hotly contested battle of Camperdown, his own ship, the *Frisheid*, and seven others falling into the hands of the British. He was taken as a prisoner of war to England, but was treated there with distinction, and upon his return to Holland was not only exonerated from blame, but commended for his gallantry and skill. In 1798 he became Minister Plenipotentiary to France, and in 1802 was reappointed to the command of the Dutch fleet and attempted to put down piracy in the Mediterranean. He was buried in the Pantheon, his heart in the Nicholas Church of Kampen.

**DE WITT, de wit, CORNELIUS** (1623-72). A Dutch naval officer. He was born at Dort and was educated at Leyden. In 1652 he and Ruyter succeeded Tromp in command of the Dutch fleet, which Blake defeated in September off Kentish Knock. Under Admiral de Ruyter he participated in the burning of the British shipping in the Medway (1667) and in 1672 took a conspicuous part in the battle of Solebay (Southwold). He was charged by Tichelaar with participation in the plot to murder the Prince of Orange and after being tortured was sentenced to banishment. As he was leaving his prison, he was attacked by the burghers of

The Hague and murdered, with his brother, Jan De Witt. He was an able officer and a man of broad general culture.

**DE WITT, JAN** (1625-72). A celebrated statesman of Holland, born at Dort, Sept. 24, 1625. He was the son of Jacob De Witt, a vehement opponent of William II, Prince of Orange. Young De Witt was carefully educated and soon exhibited remarkable ability. He was one of the deputies sent by the states of Holland in 1652 to Zealand for the purpose of dissuading that province from adopting the cause of Orange. There his eloquence secured him such universal confidence that he was made Grand Pensionary of Holland, an office to which he was several times reelected. The Orange party, supported by the populace and the clergy, was ever striving to increase the power of the young prince (afterward William III), who was then a mere infant: the Republican, or Oligarchic, party, composed of the nobles and the wealthier burghesses, at the head of which was De Witt, sought, on the other hand, to strip the house of Orange of all power and to abolish entirely the office of stadtholder. During William's minority the advantage was with De Witt and the Republicans. In 1654, on the conclusion of the war with England, a secret article was inserted in the treaty drawn up between De Witt and Cromwell, in virtue of which the house of Orange was to be deprived of state offices for all time. The accession of Charles II severed the friendly relations of England and caused De Witt to lean towards France. A commercial treaty between France and Holland was followed, in 1665, by another English-Dutch war, which lasted until the Peace of Breda, in 1667. The result was that the power of the Republican party in Holland seemed firmly established, for in the same year a perpetual edict was proclaimed abolishing forever the office of stadtholder. But in reality, however, the power of De Witt was diminished, and he was soon compelled to concede a larger measure of influence to the house of Orange. His prospects became still more clouded when the designs of Louis XIV upon the Spanish Netherlands became manifest. The Orange party carried their point in the elevation of William to the family dignity of stadtholder. On the invasion of the Netherlands by Louis XIV, in 1672, the Prince of Orange was appointed commander of the Dutch forces; and when the first campaign proved unfortunate, the popular clamor against De Witt greatly increased. He had previously resigned his office of Grand Pensionary, and now his brother Cornelius, accused of conspiring against the life of the stadtholder, was imprisoned, tortured, and condemned to perpetual banishment. De Witt went to see him on his release from prison, and as they were coming out they were attacked by an infuriated mob and were both murdered, Aug. 20, 1672. The States-General demanded an investigation and the punishment of the murderers, but the stadtholder did not take the necessary steps. De Witt was personally a man of the most upright character. Consult: *Portalia, Jan De Witt* (Eng. trans., 2 vols., London, 1885); Geddes, *The Administration of John De Witt* (ib., 1879); Motley, *History of the United Netherlands* (4 vols., New York, 1860-68); Beck, *History of the Netherlands* (ib., 1898-1907).

**DE WITT, JOHN** (1821-1906). An Ameri-

can Reformed Dutch scholar. He was born at Albany, N. Y., Nov. 29, 1821; graduated at Rutgers College in 1838 and at New Brunswick Theological Seminary in 1842; was professor of Oriental literature (1863-84) and of New Testament exegesis (1884-91) in the latter institution. He was a member of the Old Testament Company of the American Revision Committee (1872-85) and author of *The Praise Songs of Israel*; *A New Rendering of the Book of Psalms* (1885).

**DE WITT, JOHN** (1842- ). An American Presbyterian scholar. He was born at Harrisburg, Pa., Oct. 10, 1842; graduated at Princeton College in 1861 and at Union Theological Seminary, New York City, in 1865. He became professor of Church history in Lane Theological Seminary, Cincinnati, Ohio, in 1882, and of the same in Princeton Theological Seminary in 1892. He wrote a *History of Princeton University* (1896).

**DE WOLFE, ELSIE** (1865- ). An American decorator and actress, born in New York City. She made her theatrical debut in Sardou's *Thermidor* in 1891, playing the rôle of Fabienne with Forbes-Robertson. In 1894 she joined the Empire Company under Charles Frohman. In 1901 she brought out *The Way of the World* under her own management at the Victoria Theatre, and later she toured the United States with this play. She also appeared in the title rôle of Hubert Davies's play, *Cynthia* (1903), as Estelle Kitteridge in *The Other Girl* (1903), and as Mrs. Lovette in *A Wife without a Smile* (1904). She retired from the stage in 1905 and took up as a specialty artistic interior decorating. In 1913 she published *The House in Good Taste*.

**DEWSBURY**, dūz-bēr-l. A parliamentary and municipal borough and manufacturing town in the West Riding of Yorkshire, England, on the Calder, 8 miles south-southwest of Leeds (Map: England, E 3). Dewsbury is noted for its manufactures of worsted, carpets, blankets, and various kinds of heavy woolen goods. There are collieries and iron works in the immediate neighborhood. It is on three railway lines and connected by the Calder and its branches with Hull and Liverpool. Among its notable buildings are the town hall, chamber of commerce, infirmary, and grammar school. The town received its charter of incorporation in 1862 and sends one member to Parliament. It owns its water and gas works, operates its electric-light plant, and maintains public baths, cemeteries, markets, technical schools, and free libraries. A modern sewerage system has been installed in connection with a sewage farm. Pop., 1901, 51,246; 1911, 53,358. At Dewsbury, in 627, Paulinus first preached Christianity to the Northumbrians.

**DEW'WORM**. A British name for the earthworm. See EARTH'WORM.

**DEXIPPUS** (Lat., from Gk. Δέξιππος). A Greek philosopher, a follower of the Neoplatonist Iamblichus, belonging to the middle of the fourth century A.D. He wrote commentaries on Plato and Aristotle, of which one, in explanation and defense of the Aristotelian categories, has appeared in both Latin and Greek texts. The former, under the title *Questionum in Categorías Libri Tres*, was edited by Félicien (Paris, 1549); the latter by Spengel (Munich, 1859).

**DEXIPPUS, PUBLIUS HERENNIVS** (c.210-273 A.D.). A Greek rhetorician, historian, and sol-

dier. He was born at Athens and, after holding the highest offices in his native city, commanded the army against the Heruli (q.v.) when they invaded Greece and captured Athens in 269 A.D. Photius describes three of his historical works: *Tà μετὰ Ἀλέξανδρον*, a history of Macedonia from the time of Alexander the Great, an epitome, apparently, of a work of the same title by Arrianus (q.v.); *Σύγγραμμιον Ἱστορικόν* (or *Χρονικὴ Ἱστορία*), a chronological history from the earliest times down to the accession of the Emperor Claudius II, 268 A.D.; and *Σκευδικά*, an account of the war against the Scythians or the Goths, in which Dexippus himself had fought. The last-named work is frequently referred to by the writers of the *Augustan History* (q.v.). For the fragments, consult Bekker and Niebuhr, *Scriptores Historiæ Byzantinæ* (Bonn, 1829), and Müller, *Fragmenta Historicorum Græcorum*, vol. iii (Paris, 1883). A public statue was erected in his honor, the base of which with its inscription has been preserved. Consult *Corpus Inscriptionum Atticarum*, 3, 716.

**DEXTER**. A town in Penobscot Co., Me., 40 miles west-northwest of Bangor, on the Maine Central Railroad and on the Sebasticook River (Map: Maine, C 3). It contains a public library. There are woolen mills, machine shops and foundries, and vegetable canneries. The water works are owned by the town. Pop., 1900, 2941; 1910, 3530.

**DEXTER, EDWIN GRANT** (1868- ). An American educator, born at Calais, Me. He graduated in 1891 from Brown University, where he taught for a year and then (between 1892 and 1899) was science master of Colorado Springs High School, director of the Colorado Springs Summer School of Science, Philosophy, and Languages, and professor of psychology in the State Normal School at Greeley, Colo. In 1899 he gained a Ph.D. at Columbia University and the higher diploma of Teachers College. From then until 1907 he served at the University of Illinois in various capacities—as professor of pedagogy and psychology, director of the summer term, director of the School of Education, and dean. He became commissioner of education in Porto Rico and chancellor of the University of Porto Rico in 1907. He was president of the National Society for the Scientific Study of Education in 1905-06 and president of the child-study section of the National Education Association in 1905-07. Besides serving as associate editor of the *Internationales Archiv für Schulhygiene* and of the *Jahrschrift für Korpeliche Erziehung* and contributing some 50 articles to scientific and educational journals, he is author of *A History of Education in the United States* (1904) and *Weather Influences* (1904).

**DEXTER, HENRY MARTYN** (1821-90). An American clergyman and historian. He was born in Plympton, Mass., son of a Congregational minister, graduated at Yale in 1840 and at the Andover Theological Seminary in 1844; and was pastor of a Congregational church at Manchester, N. H., from 1844 to 1849, and of the Berkeley Street Congregational Church in Boston from 1849 until 1867. He edited the *Congregationalist* from 1851 till his death, becoming in 1867 editor in chief of the *Recorder*, in which the *Congregationalist* had been merged; and he edited the *Congregational Quarterly* from 1859 to 1866. He held a pastorate at Dorchester, Mass., from 1869 to 1871, and from

1877 to 1880 delivered annual courses of lectures on Congregationalism at Andover Theological Seminary. He wrote on the history of the Congregational church and the ecclesiastical history of New England and left his library to Yale University. Among his publications are: *The Voice of the Bible the Verdict of Reason* (1858); *Congregationalism: What it is, Whence it is, How it Works, Why it is Better than Any Other Form of Church Government, and its Consequent Demands* (1865); *The Church Polity of the Pilgrims the Polity of the New Testament* (1870); *Roger Williams and his Banishment from the Massachusetts Colony* (1876); *The Congregationalism of the Last Three Hundred Years with a Bibliographical Appendix*, of 7250 titles (1881)—his most valuable work and the most important book on the subject; *A Handbook of Congregationalism* (1880); *The True Story of John Smythe, the Se-Baptist* (1881); *Common Sense as to Woman Suffrage* (1885); *Early English Exiles in Amsterdam* (1890); and with his son, Henry Morton Dexter, *The England and Holland of the Pilgrims* (1905), posthumous. He also edited *Church's Eastern Expeditions and Entertaining Passages Relating to King Philip's War, and Mourt's Relation*; and left in manuscript *A Bibliography of the Church Struggle in England during the Sixteenth Century and the Pre-History of Plymouth Colony, with the English and Dutch Life of the Plymouth Men*.

**DEXTER, HENRY MORTON** (1846-1910). An American clergyman, historian, and editor, born at Manchester, N. H., son of Henry Martyn Dexter. He graduated from Yale University in 1867 and from Andover Theological Seminary in 1870, spent three years in travel, was ordained to the Congregational ministry, and served as pastor of the Union Church at Taunton, Mass. (1873-78). From 1878 to 1891 he was editor of the *Congregationalist*. During several visits to England and Holland he made investigations, particularly of the history of the Pilgrims and early American colonists, and he prominently promoted the erection of a memorial tablet to John Robinson at Leyden, Holland, in 1891. Besides magazine articles on historical subjects, he is author of *The Story of the Pilgrims* (1899) and *England and Holland of the Pilgrims* (1905).

**DEXTER, SAMUEL** (1761-1816). An American jurist. He was born in Boston, graduated at Harvard in 1781, and was admitted to the bar in 1784. He was a member of the State Legislature and served in Congress both as Representative and Senator. He was appointed Secretary of War in June, 1800, and from December of this year until the inauguration of Jefferson was Secretary of the Treasury. He published a *Letter on Freemasonry*; *Progress of Science*, a poem (1780); *Speeches and Political Papers*.

**DEXTER, TIMOTHY** (1743-1806). An American merchant, born at Malden, Mass. He rose to great affluence, but is memorable chiefly for his eccentricities. Assuming the title of Lord Timothy Dexter, he built extraordinary bizarre houses at Newburyport, Mass., and Chester, N. H. The garden of the former he adorned with about 40 colossal wooden statues of famous men, including himself. He also maintained a poet laureate and formed a collection of paintings composed entirely of daubs. He was the author of *A Pickle for the Knowing Ones* (1838; reprinted, 1881). Having been troubled by his

printers in regard to punctuation, he retaliated by writing a pamphlet without a comma or any other point, but displaying at the end half a page of points in a mass, with the invitation to his readers to "pepper the dish to suit themselves." He also rehearsed his own funeral procession in the most elaborate manner and cased his wife for not weeping at the sight of the cortege.

**DEXTRIN**, dēks'trin (from Lat. *dexter*, right, referring to its power of turning to the right the plane of polarized light). A name applied to several organic substances produced by the action of malt extract, saliva, or pancreatic juice upon starch paste, the first product of the transformation being soluble starch, and dextrin being produced by the hydrolysis of the latter. A continuation of the hydrolytic action results in the formation of sugars. The principal dextrans are erythrodextrin, achrodextrin, and maltodextrin, all of which have the same relative composition as starch ( $C_6H_{10}O_5$ ); their molecular weights, however, are unknown, and the first two are very probably mixtures. Achrodextrin may be prepared by the prolonged action of saliva or pancreatic juice on starch paste; when the solution ceases to be colored by the addition of iodine, i.e., when all the starch has been transformed, the solution is concentrated by evaporation and precipitated with alcohol. The substance thus obtained is completely freed from maltose by warming with mercuric cyanide and caustic soda and may be further purified by dissolving in water and reprecipitating with alcohol. Maltodextrin appears to be a pure chemical compound, and its molecule is known to contain an aldehyde group. See ALDEHYDES.

Dextrin (British gum or starch gum) is often used as a substitute for gum arabic in the processes of calico printing and for stiffening different goods; it is also applied to the back of postage stamps. Its value as a substitute for gum consists in its being more flexible and less brittle, when dry, than that substance. For commercial purposes it is prepared on a large scale either by moistening potato starch with weak nitric acid, then drying and heating to 110° C., or by simply heating the starch to about 250° C. When thus prepared, dextrin contains considerable amounts of dextrose and unaltered starch. An excellent substitute for dextrin as a textile finish is now made by heating equal weights of starch and glacial acetic acid at 90° C. (194° F.) for two or three hours. The product, which is commercially known as *feculose*, is chemically a polyacetate, or rather a mixture of acetates, of dextrin.

**DEXTROSE**. See GLUCOSE.

**DEX**, dā (Turk. *dā*, maternal uncle). A title applied colloquially to any older, especially in former times among the Janizaries; hence, when the commander of that corps was associated with the Turkish pasha in the government of Algeria, the name was retained for him and then, by extension, came to be applied to any pasha or regent. Early in the eighteenth century the Dey of Algiers emancipated himself from the authority of the Sultan. Tunis and Tripoli were also sometimes ruled by deys in place of the bey (q.v.).

**DHABB**, dāb, or **DHOB**, dōb. See DABB.

**DHAKA**. See DACCA.

**DHAK TREE**, dāk or dāk. See BUTEA.

**DHAL**, dāl. See PIGEON PEA.

**DHAWAR**. See DAMAR.

**DHAMMAPADA**, d'hūm'mā-pūd'ā (Pāli, footprint of right). The name of a division of the sacred writings of the Buddhists. It has been translated by Max Müller, in vol. x of the *Sacred Books of the East*; while the Pāli text was published, with a Latin translation, by V. Fausbøll (Copenhagen, 1855), and an important Pāli commentary was edited by H. C. Normand (London, 1909-12). For selections, consult Anderson, *Pāli Reader* (London, 1901-07).

**DHANIS**, dā'nēs', FRANÇOIS, BARON (1859-1909). A Belgian explorer, born in London. He early went to Africa to aid in extending the Belgian possessions there, in 1888 founding several stations on the Middle Congo and in 1890 exploring the Stanley Falls region to the river Kwango. Attacked by Arab slave raiders, he marched against several fortified Arab towns and succeeded, after two years of hostilities (1892-93), in establishing the supremacy of the Congo Free State. He returned to Belgium and was raised to the rank of Baron; but in the next year (1895) he was sent back to the Congo as Vice Governor. During an attempted expedition to the Nile in 1896-97 the black troops mutinied, Dhanis's brother was killed, and Dhanis himself barely escaped. The last 10 years of his life were spent in retirement in Belgium.

**DHAR**, dār. The capital of a native state of the same name in Central India, situated 33 miles west of Mhow and 1908 feet above the sea (Map: India, C 4). It is surrounded by brick walls and contains two large mosques. Ruins of an ancient fortification, a mosque, houses of worship, and tombs testify to the former greatness of the city, which is said to have had a population of 100,000. It is the centre of grain trade for the district. Pop., 1901, 17,792; 1911 (est.), 15,000.

**DHARMAŚĀSTRA**, d'hār'mā-shās'trā. The name given to the metrical law books of Manu, Yajñavalkya, and others. The law book of Manu is relatively recent, but its date cannot be definitely fixed. It is translated by Burnell (London, 1884). Yajñavalkya's work dates from the third century A.D. A collection of these texts is given in the *Dharmaśāstrasangraha*, ed. by Pandit Jīhananda Vidyāśagara (Calcutta, 1876). Consult Jolly, "Recht und Sitte," in Bühler's *Encyclopædia of Indo-Aryan Research* (Strassburg, 1896), with bibliography.

**DHARMASŪTRA**, d'hār'mā-sū-trā. A division of the Sūtra, or ritual literature connected with the Vedas. They are works which fix the rules of life in relation to others, and are the source of the Dharmaśāstra.

**DHĀRWAR**, dār'wār. The capital of a district of the same name in the Presidency of Bombay, India, close to the frontier of Madras (Map: India, B 5). It has a strong fort, and government and native schools, and is an important railway centre. It has railway connection with Marmagao in the Portuguese Colony of Goa, through which port it carries on an extensive export trade in cotton. It has a large jail, and prisoners manufacture carpets, table linen, cloths, and cane goods. It is the headquarters of the Southern Mahratta Railway. Pop., 1901, 31,279; 1911, 30,289.

**DHAUN**, COUNT VON. See DAUN.

**DHAWALAGIRI**, dā'hwā-lā-gē'rē, or **DHWALAGIRI**, or **DHAULAGIRI** (Hind., white mountain). One of the highest peaks of

the Himalayas (about 27,000 feet), situated in Nepal, near the parallel of 29° N. (Map: India, D 3).

**DHEGIIHA** (d'hā'gē-hā) **INDIANS**. A group of Siouan tribes, which included the Osage, Omaha, Quapaw, Kansas, and Ponca Indians. See **SIOUTAN STOCK**.

**DHOLE**, dōl. A wild dog of India. See **Dog**. **DHOUBRA**, dōō'rā. See **SORGHUM**, paragraph *Nonsaccharine*.

**DHOW**, dou. A vessel common to the Arabian Sea and the east coast of Africa. It is usually from 150 to 250 tons' burden by measurement and is built like a grab (q.v.) with 10 or 12 ports. The rig is usually lateen with a single mast and sail, and the latter is set on an enormous yard which is as long as the vessel. The halliards of the yard consist of a pendant and threefold purchase. The lower block of the tackle is secured to the weather rail, and the end of the fall is also made fast there; the tackle thus becomes the backstay for supporting the mast, the only other rigging on it being three shrouds each side. Vessels of this type were regularly employed in the slave trade on the east coast of Africa.

**DHULIP**, d'hū-lēp', or **DHULEEP SINGH** (1838-93). An Indian maharajah, son of the famous Ranjit Singh, ruler of the Sikhs. Upon the death of his brother Charak Singh, Dhulip, although still in his minority, succeeded to the throne, but, after a prolonged but ineffectual warfare against the English, was compelled by the Peace of Lahore (1846) to turn over the administration to the British. A rising of the Sikhs in 1849 resulted in his renouncing the throne in consideration of an annuity of £40,000. He was educated in England and became a Christian. He married a German in 1864 and after her death an Englishwoman. An attempt to re-establish his authority in 1886 (when he abjured Christianity) proved unsuccessful and resulted in the loss of his pension. After a desultory career in Russia and France, he was pardoned by the Queen, and his pension was renewed. He died in Paris from an attack of apoplexy.

**DHUNCHEE**, dūn'chē (E. Ind.), *Sesbania aculeata*. A plant of the family Leguminosæ. The dhunchee is an annual herbaceous plant, much cultivated in India on account of its fibre; it has an erect, sparingly branched stem, 6 to 10 feet high. It is a plant of rapid growth and succeeds best in low and wet soils. Its fibre is coarser than hemp, except when it is cut at a very early period of its growth; it is durable in water, but contracts considerably when wetted. It is steeped and prepared very much like sunn (q.v.). It is native to the Malabar coast and is also grown in China. It is sown at the rate of 30 pounds of seed per acre. The yield varies within wide limits, about 500 pounds of fibre per acre being a fair average.

**DHYAL BIRD**, d'āl-bērd', or **DAYAL** (native of E. Ind.). An Oriental bird of the genus *Copsychus*, of which six or seven species are familiar visitors to gardens and villages throughout southeastern Asia. They belong to the thrush family, subfamily Ruticillinae. The best known is *Copsychus saularis*, common from Ceylon to China, and reminding British residents of their robin redbreast by its confiding and cheerful ways. It builds a rude nest in a hole in a tree and during the breeding time is comically pugnacious. It has a pleasing song, and all the species are kept as cage birds and are

susceptible of learning tricks. The dress of the male is black and white; that of the female brownish.

MALACCA DHYAL BIRD  
(*Coryphus macleodii*).

**DHYĀNI BUDDHA**, d'hi-ā'nē būd'dā (Skt., meditation Buddha, from *dhyāni*, devoted to meditation, from *dhyāna*, Pali *jhāna*, meditation, from *dhyā*, to meditate + *buddha*, enlightened, p.p. of *budh*, to awake). One of five Buddhas, named Vairocana, Akshobhya, Ratnasambhava, Amitabha or Amitayū, and Amoghasiddhi, with their female counterparts, called Taras or Saktis. In some Buddhist texts their number is raised to 6, 10, or even more. They are distinguished from the Adi Buddha (q.v.), or primeval Buddha, and all other incarnate Buddhas (Maushī Buddhas), as well as from the potential future Buddha or Bodhisattvas, by being eternal, noncorporate, and produced from meditation alone. Thus they correspond to the archetypal ideas of the Platonic philosophy, the human Buddhas and the Bodhisattvas being conceived as incarnations or emanations of the ideal Buddhas, and may in a certain sense be considered as the gods of the essentially atheistic Buddhism. In art the Dhyani Buddhas are of the customary Buddha type, but are distinguished by varieties of ornamentation of their lotus seats and also by the positions of their hands and sometimes by different colors of paint. Their sanctuaries, which have the shape of a pile of rice, are termed *caityas*, instead of *vihāras* and *stupas*. See **BUDDHISM**.

**DIABASE** (from Gk. *di-*, *di-*, double + *basas*, *basis*, base, a going, from *basiv*, *basiv*, to go; influenced in form by Gk. *diabasos*, *diabasis*, passage, from *di-*, *dia*, through + *basas*, *basis*, a going, base). A crystalline igneous rock, of which the essential constituent minerals are lime-soda feldspar and pyroxene (augite). The texture of diabase while generally crystalline throughout, differs from that of granite in that the augite incloses the feldspar, owing to the later period of augite crystallization. The feldspar of diabase is usually in bladed crystals, which take all directions in the augite and give the rock a peculiar interlocking radial texture, which is especially noticeable in specimens of

coarse grain. If the grains of augite be large in comparison with the size of the feldspar blades, the effect produced is a noteworthy mottling which is described as "lustre mottling." The average chemical composition of diabase varies but little from that of gabbro (q.v.), the difference of the two rocks being chiefly of structural nature. The closest affinities exist chemically, mineralogically, and texturally between diabases and basalts (q.v.), and, indeed, most American petrographers recognize no important difference between them; the rocks of greater geologic age, which consequently show greater decomposition, being, however, more generally described under the term "diabase" and the more recent occurrences as "basalt." Olivine, if present in a diabase, makes the rock an olivine diabase. Diabase is quite subject to alteration, the augite being replaced by hornblende and the olivine (if present) by serpentine. Both of the newly developed minerals being green, the rock assumes by this alteration a greener color. Important occurrences of diabase are those of the copper-bearing Keweenaw series of Lake Superior; the Palisades of the lower Hudson River, and the Hanging Hills of Meriden, Conn., of Jura-Triassic age; and those of the Deccan plateau of southern India. See **GREENSTONE**; **BASALT**, **TRAP**.

**DIABELLI**, dyā-bē'le, ANTONIO (1781-1858). An Austrian composer and music publisher, born at Mattsee, near Salzburg. He studied with Michael Haydn and in 1803 settled in Vienna as a teacher of piano. In 1824 he established the publishing house of Diabelli & Co., which became one of the chief publishers of the works of Schubert. As a composer, he was exceedingly productive and cultivated all the forms. But his works are now forgotten, with the exception of his sonatas written for pedagogical purposes. These are still highly valued and likely to retain a permanent place among the best instructive works for pianoforte.

**DIABETES**, diā-bē'tēz (Neo-Lat., from Gk. *diabētēs*, *diabētēs*; first used by Aretaeus c.150 A.D.), siphon, from *diabainein*, *diabainein*, to stride, go through, from *di-*, *dia*, through + *basiv*, *basiv*, to go). A disease of which the principal symptom is an abundant flow of saccharine urine. Diabetes is of two kinds: 1. *Diabetes insipidus* is a mere symptom of a functional condition now generally termed *polyuria*, or an increased flow of normal (non-saccharine) urine, excessive thirst accompanying it; it is infrequent and not dangerous. 2. *Diabetes mellitus* (Lat. *mel*, honey) is a grave disease in which the liver does not perform its proper work in transforming starches and sugars during assimilation, and large quantities of liver sugar (resembling grape sugar) appear in the urine. Inositol (q.v.), or "muscle sugar," also appears in some cases in the urine. The cause of the disease is obscure, the pathology is uncertain, and the treatment is unsatisfactory. It is more common in males than females, and in Jews and Hindus than in other races. Although no age is exempt, the disease is most likely to develop in late middle life (40 to 60). The sedentary and well-fed classes are peculiarly liable to attack, although severe cases occur among the very poor. There is often a history of prolonged worry, or of fright or injury to the nervous system. Patients suffering from diabetes, besides urinating very frequently and in

large quantities, experience distressing thirst, with dryness of mouth and lips; loss of appetite, muscular weakness, emaciation, occasional ulcers, altered sight, and mental changes, generally consisting of confusion of ideas, indecision, and melancholia. In treating diabetic patients a diet is prescribed of gluten bread, skim milk, cheese, eggs, meats, fresh fish, green vegetables, tomatoes, and sour pickles. Sugars, starches, and indigestibles should be absolutely avoided. Bread made of gluten flour is very unpalatable, and, practically, the strict diet is rarely observed by the patient. Van Noorden showed, in 1903, that oatmeal may be substituted for bread without increase of glycosuria; Mossé reports similar results with potatoes, in a smaller proportion of diabetics and in the less severe cases. Several drugs are used, with varying success, including bromides and salicylates, opium, arsenic, and digestants. Milk soured with the Bulgarian bacillus has enjoyed some little repute in late years. It probably benefits by decreasing intestinal fermentation. Recovery is very rare. Death occurs either from diabetic coma or from lung complications or gangrene, to which such individuals are very susceptible. Temporary *glycosuria*, or sugar in the urine, occurs in some people after the use of chloral or the administration of an anæsthetic. Some always have a little sugar in the urine without having any other symptom of diabetes, especially gouty or very fat people. Diabetes is not, as is popularly supposed, a disease of the kidneys. No pathological changes are characteristic. Lesions of the medulla have been described, but the theory of a distinct "diabetic centre" in the medulla seems as yet to lack sufficient confirmation. Probably the most constant lesions are those found in the pancreas as noted by Langerhans. The most common change is a simple atrophy of the pancreatic tissue, with or without an increase in the interstitial connective tissue. Complete extirpation of the pancreas was shown to cause permanent diabetes in animals by Minkowski and V. Mering, in 1889. Opie, in 1900, discovered a connection between diabetes and disease of certain groups of pancreatic cells, called the "islands of Langerhans." It is now believed that these cells secrete a starch ferment which finds its way into the general circulation through the rich capillary network that surrounds them. Children of diabetic parents exhibit glycosuria during psychic strain or under amylaceous diet and need most careful rearing. Consult Fuchter, in Osler's *Modern Medicine*, vol. i (New York, 1907), and authorities there mentioned, and Allen, *Studies Concerning Glycosuria and Diabetes* (Boston, 1913). See DIET.

**DIABLE BOITEUX**, də'ā'b'l' bwa'tē', Lē (Fr., The Lame Devil). A famous satirical romance in dialogue form, by Le Sage (1707). It deals with the wonders wrought by a spirit, Asmodeus, whom Don Cleofas has accidentally released from imprisonment in a glass jar, and is chiefly derived from *El diablo cojuelo*, a Spanish work by De Guevara (1641). The satire furnished the basis for Foote's comedy *The Devil upon Two Sticks*.

**DIABLETETS**, də'ā'b'l'-rā' (Fr., little devils). A group of peaks in the northern Bernese Alps, Switzerland, situated about 15 miles southeast of Lake Geneva, in the bend of the Rhone, in lat. 46° 20' N. (Map: Switzerland, B 2). They range from 900 to over 10,500 feet high and are covered with glaciers on the north and east

slopes. Owing to their strata of limestone, sandstone, and gypsum, the Diablerets are gradually being undermined, and their mountain masses fall from time to time with destructive effect.

**DIACHYLON**, dī-āk'ī-lōn (Gk. *διάχυλος*, *diachylos*, very juicy, from *διά*, *dia*, through + *χυλός*, *chylos*, juice. A deceptive etymology). The common healing or lead plaster, made by combining litharge with olive oil. *Diachylon ointment* contains 500 parts of diachylon plaster, 490 parts of olive oil, and 10 parts of oil of lavender flowers.

**DIACRITICAL MARK** or **SIGN**, or **DIACRITIC** (Gk. *διακριτικός*, *diakritikos*, distinctive, from *διακρίνειν*, *diakrinein*, to distinguish, from *διά*, *dia*, through + *κρίνειν*, *krinein*, to judge). A mark or sign used to distinguish different sounds or values of the same letter or character, such as those used in indicating the pronunciation or accent in this *ENCYCLOPEDIA*. Such marks or signs may arise, (a) as a degradation or gradual corruption of some combination of previously used characters, as in the case of the German unaltered vowels, *a*, *o*, *u*; or (b) they may be deliberately invented or chosen for some special purpose, as in most of the systems used for phonetic respelling in works of reference or in philological works.

Some of those in the first class were developed by writing one letter above, as a means of saving time or space, especially at the end of a line, when books were made by copying by hand. Thus, the German *a*, *o*, *u* were originally *ā*, *ō*, *ū*, and the superior letters were, for convenience sake, reduced to two dots. So the Swedish *d* or *Å* was originally *ao* or *Ao*, written with the *o* over the *a* or *A*, this *o* being finally changed into a simple circle. The cedilla (literally, little *zed* or *z*), on the other hand, is a degradation of a variant form (*3* or *3'*) of the letter *z*, which was formerly written after the letter *c* to show that it was to be pronounced like *s*, when without the cedilla it would have had the sound of *k*. It is now chiefly used in French and Portuguese words. Likewise in Greek, the *iota subscript* was originally the second vowel of a diphthong and was written on the line and sounded, as in other diphthongs. But afterward (about 100 B.C.) it ceased to be pronounced, being swallowed up by the long *ā*, *η*, *ω*, before it. The custom of writing it under the line originated about the eleventh century. The dot over the *i* was originally a stroke similar to our modern acute accent (*´*), which served for the purpose of distinguishing it from the shaft of an *n* or an *m*. It is still used in that form over the Roman numerals in the prescriptions of physicians. So in the angular German running hand the sign *u* is placed over the vowel *u* to prevent confusion with *n*. The number of these diacritical marks resulting from degraded forms now or formerly employed in the various civilized languages is very large; but most of those now in use have either lost their primitive meaning or are of forgotten origin. To the class of arbitrarily invented or chosen diacritical marks belong most of those now in use in the alphabets of the civilized nations or races, such as those used in phonetic respelling and those used in the ordinary alphabets of many European nations whose alphabets have become fixed during comparatively recent times, as in the various Slavic alphabets, the Hungarian alpha-

bet, etc. The points used in the Hebrew and Arabic alphabets, as well as those used in Avestan, are arbitrary inventions used to indicate the vowels or modifications of the consonantal sounds of the original characters.

The diacritical marks which occur in the printing of common English words are the diæresis [-], the hyphen [-], the cedilla [ç], the acute accent ['], the grave accent [˘], and the tilde [˜]. By some authors the letter *h* when written after *c* or *s* or *t* is treated as a simple diacritic, although it is not properly a diacritical mark. The diæresis is a survival of the Greek use of two dots over *i* or *u* to show that they did not form a diphthong with the preceding vowel. It is used in the same way in English. The tilde is used in English only over foreign-derived words, as in the word *cañon*. It is a degradation or corruption of the letter *n*, which was formerly indicated in many words by making the sign *ñ*, or even a straight mark [-] over the preceding letter, as *año* = *anno*. When final *-ed* is to be pronounced contrary to the usual rule, the fact is customarily indicated by using the grave or acute accent, thus, *reached*; and in the same way the fact that a final *-e* is to be pronounced is often indicated, thus *Brontè*. The hyphen sometimes serves the purpose of the diæresis, as in *re-entry*. Some of the characters used in phonetic repelling have by long usage become more or less fixed in significance: thus, the signs *˘* and *˙* placed over vowels are practically always used to denote long and short sounds respectively; and the sign *˜*, called by many the circumflex accent, usually denotes a long sound, as it did in Greek. In many modern English scientific works the acute accent ['] is used to denote a short accented vowel, and the grave accent [˘] is used to denote a long accented vowel. So the scheme of diacritical marks used in this *ENCYCLOPEDIA* is in very general use to indicate the sounds here denoted by them, being essentially the same as those employed in Webster's International Dictionary, and in various other preceding or abridged editions of the same work, and in the majority of the school books of the country. The system of the Century Dictionary is in many respects quite different, and that of the great English dictionary edited by Dr. Murray (*A New English Dictionary on Historical Principles*) is still different and extremely complex. The system used by the Standard Dictionary contains fewer diacritical marks, the differentiation being obtained by the use of the alphabet arbitrarily devised and selected for use by the American Philological Association. At present there is a growing tendency to adopt the alphabet of the International Phonetic Association, which is in almost universal use among phoneticians. For a list of these characters, see the articles *PHONETICS*; *PRONUNCIATION*, etc., and for the various diacritical marks employed in any language, consult a grammar of that language.

**DIADDEM** (Lat. *diadema*, Gk. *διάδημα*, *diadēma*, fillet, from *diadeiv*, *diadein*, to bind round, from *diá*, *dia*, through + *deiv*, *dein*, to bind). The name given to the fillet of silk, woolen, or linen which served as the distinguishing ornament of kings. It was generally narrow, being only a little broader on the forehead. The diadem of Bacchus, as it appears in ancient sculpture, was a plaited band going round the forehead and temples and tied behind, with the

ends hanging down. Among the Persians the diadem was bound round the tiara or turban and was of a blue color worked with white. The early Roman emperors refrained from using this ornament in order not to call up recollections of the hated kingly office. Diocletian was the first to introduce it again.

**DIADDEM SPIDER** (so called from the marking). The common cross spider (*Argiope diadema*), common everywhere in European gardens. See *SPIDER*.

**DIADUMENOS** (Gk. *διαδόμενος*, *diadoumenos*, binding round, from *diadeiv*, *diadein*, to bind round). A celebrated statue by Polyclitus (q.v.), representing a youthful athlete binding the fillet about his head.

**DIÆRESIS**, di-er'-e-sis. See *DIACRITICAL MARK*.

**DI'AGEOTROPISM** (Gk. *διά*, *dia*, through + *γῆ*, *gê*, earth + *τρόπος*, *tropos*, a turning). That form of geotropism, i.e., sensitiveness to gravity, wherein the bending organ comes to grow in a direction at right angles to the direction of gravity. Rhizomes and runners of many plants possess this property. See *GEOTROPISM*.

**DI'AGNOSIS** (Gk. *διάγνωσις*, *diagnôsis*, discrimination, from *diagignôskai*, *diagignôskain*, to discriminate, from *diá*, *dia*, through + *γινώσκω*, *gignôskō*, to know). The determination of the nature of a disease as well as of the condition of the organ or tissues affected. This is the most important and difficult element in the practice of medicine. The methods of diagnosis are based on a study of symptoms, such as chill, fever, pallor, delirium, and physical signs, such as are appreciated by examination of the throat, chest, abdomen, eyes, urine, etc., with the aid of the thermometer, stethoscope, microscope, ophthalmoscope, electric battery, etc. To learn to make a diagnosis, the pupil must study disease at the bedside, and diseased and normal tissues, fluids, and organs, in the autopsy room and the laboratory, following the course of symptoms and signs from the invasion of disease to recovery or death.

**DIAGONAL** (Lat. *diagonalis*, from Gk. *διαγώνιος*, *diagônios*, diagonal, from *diá*, *dia*, through + *γωνία*, *gônia*, angle). In plane geometry, a straight line joining any two nonadjacent vertices of a rectilinear figure. A line between two adjacent vertices would coincide with a line of the figure, and hence a triangle has no diagonal. An ordinary four-sided figure, a quadrilateral, has two diagonals; a pentagon, five; a hexagon, nine, and so on. The general expression for the number of diagonals in such figures of *n* sides is  $\frac{n(n-3)}{2}$ , where *n* represents the number of sides. Thus, the number of diagonals in a dodecagon (q.v.), a polygon of 12 sides, is  $\frac{12(12-3)}{2} = 54$ . If the polygons are general, i.e., composed of lines of indefinite extent intersecting in the maximum number of points, the number of diagonals is given by the formula  $\frac{n!}{8(n-4)!}$ , where *n* is the number of sides; e.g., in a general quadrilateral, a figure formed by four lines of indefinite length intersecting in six points, there are  $\frac{4!}{8} = 3$  diagonals, as is easily seen by drawing the figure.

Similarly, in a general dodecagon the number of diagonals is  $\frac{12!}{8(12-4)!} = 1485$ .

A diagonal of a solid bounded by limited planes is a line joining any two vertices so situated that the line does not lie in any face. The number of diagonals that can be drawn in any regular polyhedron (q.v.) is given by the formula  $ns - \frac{n^2(s-2) - v}{2s^2}$ , where  $n$  is the number of faces,  $s$  the number of sides of a face, and  $v$  the number of faces grouped about the polyhedral vertices. Thus the cube has  $1 \cdot 4 \cdot \left\{ \frac{6 \cdot 4 - 3^2(4-2) - 3}{2 \cdot 3^2} \right\} = 4$  diagonals.

**DIAGONAL SCALE.** A system of lines by means of which fractional parts of a unit, usually hundredths, may be laid down or measured with compasses (q.v.). Such scales are of particular value in plotting maps from given data. (See SURVEYING.) In the figure the line from 0 to 10 represents one inch. The diagonal line which ends at 0 cuts off on the lines above

fractions of an inch,  $\frac{1}{100}$ ,  $\frac{2}{100}$ ,  $\frac{3}{100}$ , and so on. The next diagonal line cuts off  $\frac{1}{100}$ ,  $\frac{2}{100}$ , ... of an inch; and so on. A pair of compasses may be set by such a scale so that its points are 1.01, 1.02, ... 1.11, 1.12, ... 1.21, 1.22, ... 1.99 inches apart, and thus be used to plot chains and links on a map of a given scale.

**DIAGORAS** (Gk. *Διαγόρας*). A Greek poet and philosopher of the fifth century B.C., born in Melos, an island of the Cyclades. He is said to have been a disciple of Democritus (q.v.) and to have resided long in Athens, where he won considerable distinction as a lyric poet, but only the scantiest fragments of his verses survive. He is better known to the later world, however, as an atheist, and as such is alluded to (some think) by Aristophanes in the *Clouds*, 830 (423 B.C.); he is definitely assailed by Aristophanes in the *Birds*, 1073 (414 B.C.). He was banished eventually for his opinions and died in Corinth. Besides his lyrics, he is said to have written a work called *Φρόνησις Λόγοι*, exposing the sacred Mysteries of Cybele and Dionysus (see BACCHUS), and a treatise entitled *Ἀπομυθήσεις Λόγοι*, 'Arguments to Dethrone the Deities.' Consult Zeller, *Philosophie der Griechen*, i (1892), and Starkie's edition of the *Clouds*, pp. 331-332 (London, 1911).

**DIAGRAM** (Lat. *diagramma*, Gk. *διάγραμμα*, figure from *διαγράφειν*, *diagraphēin*, to describe, from *διά*, *dia*, through + *γράφειν*, *graphein*, to write). A figure so drawn that its geometric relations may illustrate the relations between other quantities. The area of a rectangle is the product of the numbers representing its length and breadth; the diagram of a rectangle is the

visible symbol, corresponding to the equation  $a = bl$ ; and, by analogy, the rectangle may be used to symbolize any quantity which is the product of two factors. Similarly, a parallelepiped may symbolize any quantity which is the product of three factors.

The purpose of mathematical diagrams in mathematical treatises is to assist the reader to follow the reasoning set forth in the text. It serves its purpose if those features which form the subject of the discussion are clearly brought out. The object in many cases, however, is simply illustration, and it is necessary only that the idea be clearly presented, accuracy of drawing being relatively unimportant—e.g., those showing electric connections require only a proper representation of the parts in their association with one another. Other diagrams, as those drawn for workmen by architects and engineers, are intended to furnish magnitudes or distances by actual measurement, and their execution cannot be too accurate.

A profile diagram shows such an outline as would be formed, e.g., if a hill were cut through by a vertical plane, and the material on one side of the plane were removed. Evidently a succession of such profiles might be laid on the same sheet of paper, the lines being distinctly drawn, and the whole would serve to compare several vertical profiles of the same mass. It is not necessary that vertical and horizontal measurements should conform to the same scale, provided each series of measurements is consistent in itself. Thus, *geographic* profiles, which include upon a single sheet the outlines of entire continents and ocean beds, usually have the vertical measurements on a scale several times as great as that used for horizontal distances; otherwise the diagram would be made inconveniently long, or the heights would be inconspicuously small. A *topographer's contour map* exhibits a series of curves, such as would be formed if a series of horizontal sections were made, and the outlines carefully drawn on paper. The drawing really shows the horizontal projections of the contour lines upon a surface parallel to the system. In *mechanical drawings*, particularly those designed to guide workmen in the construction of machinery, several connected views of the same object are required, each view giving some information which the others cannot furnish. Suppose that three planes are perpendicular to one another, like the bottom, one side, and one end of a rectangular box, and let an object, as a hexagonal nut, be placed within the trihedral angle thus formed. Looking from the front, we see an image of the nut projected against the back of the box; from the side, a different image is seen against the end of the box; from above, a third form appears against the bottom, while from some or all of these figures the necessary measurements may be obtained. If now the end of the box is swung outward into the plane of its back, and then both together are laid back into the plane of the bottom, we have the three coexistent drawings in one plane, and they may be transferred to, or be constructed on, one sheet of paper. In many cases the same points will find representation upon each diagram, and the fact may be indicated by the same letter; while the eye may be led from one position of the point to another by lines distinctively drawn to show that they are merely guides and not parts of the outline. See GEOMETRY, *Descriptive*.

Many devices have been invented by which diagrams illustrating natural phenomena may be automatically described. The physical experiment which produces the *parallelogram of forces* is a familiar example. As a more general illustration, suppose a spring *dynamometer* (q.v.) placed where it may receive the draft of a horse when moving a carriage. Let the movement of the spring be shown by an index whose motion is back and forth along a line in the direction of the draft. Fix a pencil to the index, and let its point rest upon a sheet of paper on a plane or a cylinder which moves at a uniform velocity in a direction perpendicular to the motion of the index. The combined movements of the pencil and paper beneath it will trace a more or less irregular line. If the force of draft is constant, the pencil will remain at a constant distance from the edge of the paper, and the trace will be parallel to the edge. If the paper does not move while the pencil varies, the line will be perpendicular to the edge. If both move, and the pencil is subject to a diminishing force, the trace will be oblique, approaching one edge; while, if the force increases, the oblique trace will diverge from the same edge. Such mechanism is often arranged for instruments which indicate meteorological, physiological, or other changes, as the force and direction of winds, or the pulsation of the arteries (see SPHYMOGRAPH), or the movements of a clock combined with the observations of an astronomer. (See CHRONOGRAPH.) An important application of the same principle is found in the *indicator diagram*, by which the pressure of the steam in the steam engine and the work done by each stroke of the piston become matters of record. The paper moves with the movement of the piston, both in its excursion and return; the pencil moves at right angles to the direction of the motion of the paper, under the influence of the steam pressure, and the diagram drawn shows for each instant of the stroke the volume and pressure of the steam, while the total area of the diagram indicates the amount of work done. A mechanical device to illustrate the luminosity of various colors was invented by Newton and is known as *Newton's diagram*. In mechanics the stresses on the various parts of a frame or bridge are graphically exhibited by a form known as a *stress or funicular diagram*. The *seismometer*, *seismograph*, or *seismoscope* is an instrument to record the velocity, direction, and magnitude of seismic waves. See HODOGRAPH.

**DIAKOVA**, dâ'â-kô'va. A town in the extreme southeastern corner of the Kingdom of Montenegro, on a tributary of the White Drin, 20 miles northwest of Prisrend (Map. Turkey in Europe, C 3). Pop., about 15,000 mostly Mohammedan and Roman Catholic Albanians. For over three centuries Diakova belonged to the Turks, constituting an important town in the Ottoman Vilayet of Kosovo, but was occupied by Servian troops in the course of the Balkan War of 1912-13, and subsequently, by arrangement of the Great Powers and by agreement between Serbia and Montenegro, was surrendered to the latter country.

**DIAL**, THE. A well-known American magazine, founded at Boston, Mass., in 1840, as the official organ of the so-called "Transcendental" school of thought. As early as 1835 the idea was conceived by members of that school of idealists of starting a paper to be called the *Transcendentalist*, and Emerson, the same year,

went so far as to suggest that Carlyle should be invited to come to America to assume the editorship of it. The scheme was not in that form realized, and the paper which finally appeared, the *Dial*, was not issued till July, 1840, with Margaret Fuller (see FULLER, SARAH MARGARET) as editor. At the end of two years she was succeeded by Emerson. The paper, through lack of funds, came to an end with the April number of 1844, after a career marked by unusual brilliance in its material and extraordinary fame on the part of its contributors. In it had been published, among others, Emerson's prose essays entitled "The Transcendentalist," "The Conservative," and some of his best-known poems, as "The Sphinx," "Woodnotes," "The Problem," and "Fate." Constant contributors were Margaret Fuller, Amos Bronson Alcott, George Ripley, James Freeman Clarke, Theodore Parker, W. H. Channing, W. E. Channing, and Henry David Thoreau, who wrote for nearly every number. A reissue of the *Dial* has been published by the Rowfant Club. Consult Cooke, *Historical and Biographical Introduction to the Rowfant reissue* (London, 1902).

**DIAL AND DIALING.** The sundial is an instrument for measuring time by means of the motion of the sun's shadow. It is an instrument of very great antiquity, the earliest mention of it being in Isa. xxxviii. 8; and before clocks and watches became common it was in general use as a timekeeper. The art of constructing dials to suit any place and situation was then an important branch of mathematical study; now the subject is more an object of curiosity than utility.

A dial consists of two parts—the *stile*, or gnomon, usually the edge of a plate of metal, made parallel to the earth's axis, and pointing towards the pole, and the *dial plane*, which may be of any hard substance, and on which are marked the directions of the shadow for the several hours of the day, their halves, quarters, etc. Dials receive various names, according, mostly, to the positions which they are constructed to occupy. When the dial plane is on the plane of the horizon, the dial is called a horizontal dial; when perpendicular to that plane, a vertical dial. An equinoctial dial is one whose plane is parallel to the equator. Besides these names, there are others, such as the south dial, north dial, east dial, west dial, polar dial, declining dial, of which it is useless to write at length. These names all depend on the position of the dial plane. The cylindrical dial is a dial drawn on the curved surface of a cylinder. The ring dial is an ingenious small portable dial, but rather a curious toy than a scientific instrument.

A *night or nocturnal dial* is an instrument for showing the hour of the night by the shadow of the moon or planets. Moon dials may be constructed relative to the moon's motion; or the hour may be found by the moon's shadow on a sundial by computation.

**Dialing.** The *stile* of a dial being parallel to the earth's axis, those familiar with spherical trigonometry will readily see that the problem of constructing a dial resolves itself into that of ascertaining where the hour lines cut a given circle, with a view to the graduation of the dial plane. But even without a knowledge of trigonometry the principle may be readily understood from the following illustrations. Suppose a hollow and transparent sphere, as of glass, to represent the earth; and suppose its equator divided

into 24 equal parts by the meridians, one of them passing through a given place—say, London. (See HORIZON.) If the hour of 12 be marked at the equator, both on the latter meridian and that opposite it, and all the rest of the hours in order on the other meridians, those meridians will be the hour circles of London, because, as the sun appears to move round the earth in 24 hours, he will pass from one meridian to another in one hour. Then, if the sphere has an opaque axis, terminating in the poles, the shadow of this axis would fall, in the course of the day, on every meridian and hour, as the sun came to the plane of the opposite meridian, and would thus show the time at London and at all other places on the same meridian as London. If the sphere were cut through the middle by a plane in the horizon of London, and if straight lines were drawn from the centre of the plane to the points where its circumference is cut by the hour circles of the sphere, those lines would be the hour lines of a horizontal dial for London; for the shadow of the axis would fall upon each particular hour line of the dial when it fell upon the like hour circle of the sphere. Similarly, if we suppose the sphere cut by *any* other plane facing the meridian, the hour circles of the sphere will cut the edge of the plane in those points to which the hour lines must be drawn straight from the centre, and the axis of the sphere will pass a shadow on these lines at the respective hours. The like will hold in general of any plane, whether it face the meridian or not. The positions on the dial plane of the several hour lines can be calculated if we know the latitude of the place where the dial is to be used and the position of its plane relatively to the horizon and meridian. For a horizontal dial, the positions of the hour lines are given by the formula,  $\tan h = \sin l \cdot \tan t$ , where  $h$  is the angle between the hour and meridian lines on the plate,  $l$  is the latitude of the place, and  $t$  is the hour angle (in degrees = 15 times the number of hours between noon and the hour corresponding to the line).

The universal dialing cylinder, invented by Ferguson, is a glass cylindrical tube closed at both ends with brass plates, to the centres of which a wire axis is fixed. The tube is either fixed to a horizontal board at an angle equal to the latitude of the place, or moves on a joint, so that it may be elevated till its axis is parallel to the earth's at any latitude. The 24 hour lines are drawn on the outside of the glass, equidistant from one another and parallel to the axis. The XII on the upper side of the cylinder stands for midnight; the XII next the board for noon. When the axis is adjusted for the latitude and the board leveled, with both XII noon and midnight in the plane of the meridian, and the end towards the north, the axis, when the sun shines, will serve as stile, and cast a shadow on the hour of the day among the parallel hour lines. As the plate at the upper extremity of the cylinder is perpendicular to its axis and parallel to the equator, right lines drawn from the centre to the extremities of the parallels will be the hour lines of an equinoctial dial, and the axis will be the stile. A horizontal plate, if put into the tube, with lines drawn from the centre to the several parallels cutting its edge, will be a horizontal dial for the given latitude; and similarly, a vertical plate fronting the meridian and touching the

tube with its edge, with lines drawn from its centre to the parallels, will be a vertical south dial, the axis of the instrument in both cases serving for the stile, and similarly for any other plate placed in the cylinder. Consult: Littrow, *Gnomonik* (2d ed., Vienna, 1838); Sonnendorfer, *Theorie und Konstruktion der Sonnenuhren* (Vienna, 1864); Dawbarn, *The Sun Dial* (London, 1891); Gatty, *The Book of Sun Dials* (new ed., ib., 1900); Loeschner, *Ueber Sonnenuhren* (2d ed., Graz, 1906). Among the numerous earlier works on the subject may be mentioned: Leybourn, *The Art of Dialling* (London, 1681); Leadbetter, *Mechanick Dialling* (3d ed., ib., 1769); Emerson, *Dialling* (ib., 1770); Ferguson, *Select Mechanical Exercises* (ib., 1773).

**DI'ALECT** (Lat. *dialectus*, from Gk. *διάλεκτος*, *dialekto*, dialect, discourse, from *διαλέγεσθαι*, *dialogesthai*, to converse, from *διά*, *dia*, through + *λέγειν*, *legein*, to say). The name "dialect" is given to those varieties or peculiar forms which a language assumes among the various tribes or other local divisions of a people. It is clear that the wider the separation comes to be between the several tribes, and the more they differ in mode of life and other circumstances, the more marked will become the differences of dialect. Also, when a particular tribe of this people increases in numbers and extends its territory, the same process is repeated, and its dialect is broken into a number of subdialects. The principal check upon this tendency to seemingly endless subdivision of language is furnished by an increasing degree of common culture and civilization. Where this is wanting, as in Africa and among the native populations of America, the subdivision is practically endless.

Another element is introduced into the problem by the fact that the civilization of some tribes develops more richly and ripens earlier than that of others, while some even undergo decline; this must occasion corresponding differences of dialect. Further, one dialect may become dominant over one or more of the others, through various influences, the chief of these being the power of poetry, especially if favored by external relations. Finally, if to superior manifestations of oratory and poetry in any dialect, the conservative aid of writing be added, there is created a written language; and this passes current among other tribes to the same extent that the literature of which it is the vehicle finds favor. It is not always the dialect most perfect in itself, nor yet that of the most powerful tribe or division of a people, that comes to be the written language. Accidental circumstances have in many cases decided the rivalry. The Bible happened to be translated by a High German, Luther, into his native dialect; other works on the all-engrossing subject of religion followed in the same dialect; happily, too, the art of printing had just attained the perfection necessary to give these productions general circulation. It was this concurrence of circumstances that decided that High German should in the future be the spiritual bond between the widespread German people. For there were other dialects whose claims to the distinction were at that time equal, if not higher. Likewise the Tuscan dialect owes its ascendancy over the other Italian dialects principally to the fact that Dante, being a native of that district, used it as his means of expression. In France the government became centralized

at an early date in the city of Paris, with the result that the dialect of Ile-de-France soon overshadowed all its competitors. See **ENGLISH LANGUAGE**.

When a dialect has thus become the vehicle of written communication, and of the higher kinds of oral address, its character and position become changed, and it stands henceforth in a sort of antagonism to the other dialects, and even to that out of which it sprang. As written language is chiefly employed in the higher departments of human thought and activity, the intellectual and moral elements predominate in it over the sensible: and what it gains in dignity, precision, and pliancy, it loses in richness of inflection, in friendly familiarity, and naturalness. In conflict with this standard speech, the dialects must go to the wall. They live for a considerable time, it is true, even in the mouth of the educated classes, but they are gradually more and more confined to the most necessary and familiar forms of intercourse and lose their characteristics in the stream of the written language. They thus become, after a time, the exclusive possession of the illiterate, in which position they preserve many relics of old grammatical forms long after these have disappeared from the language of literature. But so long as a language lives, the literary standard and the dialects never cease to act and react on one another.

The chief points of difference between dialects and the standard tongue fall under four heads. 1. The first consists of differences in the elementary sounds, each dialect having a tendency to substitute some one or more vowels or consonants for others. Thus, the standard English *bold* is, in Ireland, *bould*; in Scotland, *bauld*; *what*, where the *h* is nearly evanescent, becomes, in a Scotchman's mouth, or rather throat, *chwat*, and, in Aberdeenshire Scotch, *fat*—*f* in this dialect being regularly substituted for *wh*, or rather *hw*. 2. Each dialect has peculiarities of grammar. In many parts of England and in Scotland the plural of *eye* is not *eyes*, but the archaic *eyen*, or *een*, like *oren*. The habitual use of *be*, where the standard grammar prescribes *am*, *is*, *are*, etc., is prevalent in large districts of England. Of this kind is the use of the strong conjugation for the weak, or vice versa: as *loup*, *lap*, *luppen*, for *leap*, *leaped*, *leaped*. 3. Peculiarities of vocabulary. Those individual words current in one or more districts, but unknown to the standard vocabulary, are properly *provincialisms*. They are usually genuine words of an older stage of the language, that have survived longer in some localities than in others. Some provincialisms, as *learn* or *bairn*, for 'child,' *marrow* for 'fellow' or 'match,' to *greet* for 'to weep,' are common to Scotland and the north of England. Others are more local, as to *clam*, for 'to fasten' or 'cement'; *heppen*, a Yorkshire term for 'pretty near'; *thrippa*, in Cheshire, 'to cudgel.' The exclusion of such words from the standard language is often accidental, and many of them might be and are with advantage resumed; as *marrow*, *gloaming*, etc. 4. Peculiarities of intonation. This is sometimes, though with little propriety, called *accent*, which means strictly the stress laid upon a particular syllable of a word. There are no doubt local peculiarities of this kind too. The tendency of standard English, especially the more recent, is to throw the accent towards the beginning of the word; in Scotland, the tendency

lingers to say *ewy* for *ewy*. But peculiarities of intonation lie in the different ways in which the *pitch* of the voice is managed—in the musical accompaniment of articulation. Differences in this respect give rise to the monotonous drawl of one district, the angry, querulous tone of another, the singsong of a third, etc.

So long as dialectic varieties of language were looked upon indiscriminately as corruptions and barbarisms, they were noticed by schools only that such corruptions might be avoided. A more rational philology, without trenching upon the rules of good writing, considers them essential parts of the speech of a people, and a knowledge of them necessary to any thorough investigation of the genius of that speech. It is obvious that *dialect* is entirely a *relative* term, and that what we call by that name in one connection we may call a language in another connection. Thus, Greek, Sanskrit, and Latin may be called sister dialects of that primitive language from which it is held that they, as well as the other members of the Indo-Germanic family, branched off. (See **INDO-GERMANIC LANGUAGES**.) Greek spoken of by itself, however, is a language, and Ionic, Doric, Attic, etc., are dialects of it. The same holds good with the others. In practice, however nearly related the speech of two peoples may be, we do not apply the term 'dialects' unless the peoples are mutually intelligible and have a common literary standard.

For several centuries collections of dialectic words have been made, but it is only within recent years that the subject has been studied scientifically and with reference to the exact sounds of dialectic words. The last stage in the study of the English dialects is marked by the publication of J. Wright's *English Dialect Dictionary* (London, 1898 et seq.), and *English Dialect Grammar* (Oxford, 1905), which comprise the dialects of England, of the Shetland and Orkney islands, and of those parts of Scotland, Ireland, and Wales where English is habitually spoken. Skeat's *English Dialects from the Eighth Century to the Present Day* (Cambridge, 1911), Joyce's *English as we Speak it in Ireland* (London, 1910), and Sparke's *Bibliography of the Dialect Literature of Cumberland, Westmoreland, and Lancashire* (Kendal, 1907) are also worthy of note. A list of the most important glossaries and grammars of the English dialects is given in Paul, *Grundriss der germanischen Philologie* (Strassburg, 1900-09), and a shorter list may be found in Sonnenschein, *Best Literature* (London, 1895). A study of the American dialects is being conducted by the American Dialect Society, the results of which are appearing in the *Dialect Notes* (Norwood, Mass., 1890 et seq.). The investigation of the German dialects is summarized in Paul's *Grundriss*, and in Reis's *Die deutschen Mundarten* (Berlin, 1912). Of the Scandinavian languages the Swedish has been most carefully studied in this respect, several journals being devoted to the subject. For the dialects of the Romance languages, consult Gröber, *Grundriss der romanischen Philologie*, vol. i (Strassburg, 1904-06), and Gilliéron and Edmont's *Atlas linguistique de la France* (Paris, 1902-12). Consult also the *Bibliothèque de dialectologie romane* (Hamburg, 1912 et seq.), a periodical devoted to this subject. For Italian, consult Monaci's *Orestomazia italiana dei primi secoli* (3 vols., Turin, 1913). For the Greek dialects: Meister, *Die griechischen*

*Dialekte* (Göttingen, 1889); Hoffmann, *Die griechischen Dialekte* (Göttingen, 1891-93); Smyth, *Greek Dialects* (Oxford, 1894); Thumb, *Handbuch der griechischen Dialekte* (Heidelberg, 1909); Buck's *Introduction to the Study of Greek Dialects* (Boston, 1910). For the Italian dialects, consult Conway, *Italian Dialects* (Oxford, 1900). See AMERICANISMS; ENGLISH LANGUAGE; and articles on other languages.

**D'ALECTIC** (Lat. *dialecticus*, Gk. *διαλεκτικός*, *dialektikos*, from *δίαλεκτος*, *dialektos*, discourse, dialogue). A philosophic term that was probably first used by Plato to designate the Socratic method of taking up some conception and showing the inadequacy of popular views concerning it, by debating about their deficiencies and inconsistencies; hence the name given it. Aristotle used "dialectic" in the sense of probable reasoning. After this, "dialectic" came to imply a sort of word fence, the art of so using the forms of reasoning as to confound your opponent and "make the worse appear the better cause." Kant used the term to designate that part of his *Critique of Pure Reason* which exposes the fallacies into which one falls who tries in knowledge to transcend the limits of experience. Hegel restored the word to its original Socratic meaning, and called his system dialectical, meaning thereby that it sought to show the insufficiency of the conceptions in ordinary use, and to discover the missing elements,—the process of letting each conception develop its antithesis and then later with its antithesis into a synthesis which harmonizes the two. Dialectic is sometimes used as synonymous with logic.

**DIALLAGÉ**, d'yal-lā-j (Neo-Lat., from Gk. *διαλλαγή*, *diallagē*, interchange, from *διαλλάσσειν*, *diallasssein*, to interchange, from *διά*, *dia*, through + *ἀλλάσσειν*, *allassein*, to change). A thin foliated or lamellar variety of pyroxene of a green to brown color. It is seldom found crystallized, but usually massive, with a pearly lustre. Its composition is similar to that of *diopside* (calcium magnesium silicate), but it sometimes contains alumina, when it should properly be classed with *augite*. By some authorities it is believed to be an altered *augite*. It is widely distributed, and is found in the early rocks. Certain varieties, especially those possessing a characteristic lustre, have been cut and polished. The name "diallage" is also applied to the mineral *enstatite* and its ferrous variety *bronzite*.

**DIALOGUE** (Lat. *dialogus*, Gk. *διάλογος*, *dialogos*, speech, from *διά*, *dia*, through, across + *λόγος*, *logos*, speech, from *λέγειν*, *legein*, to speak). A conversation between two or more persons, implying, however, greater unity of subject and formality than an ordinary conversation. The Socratic dialogue is a conversation in the form of question and answer, so contrived that the person questioned is led himself, to all appearances, to originate the ideas the questioner wishes to bring before him. The dialogues of Plato are philosophical dramas, in which the Socratic method of investigation is brought to bear upon speculative subjects. Among the ancients the dialogue was a favorite form for didactic literature. Aristotle employed it, but in less dramatic form than Plato; he himself always played far the larger rôle in the conversation. Heracles (q.v.) introduced as the *dramatis personæ* famous men of a bygone time. Cicero commonly chose the Aris-

totelian dialogue form for his philosophical works; his *Lælius* (*De Amicitia*) and his *Cato Maior* (*De Senectute*) are rather Heracleian. Lucian employs the dialogue for purposes approaching those of the drama. One of Tacitus' works was entitled *Dialogus de Oratoribus*. Of the more eminent modern writers in this form, we may mention Erasmus in Latin; Hutten, Lessing, Herder, Wieland, and Schelling among the Germans; Petrararch, Macchiavelli, Tasso, and Galileo in Italy; Fénelon, Fontanelle, and Voltaire in France; Valdés and Carducci in Spain; and Berkeley, Hurd, and Harris in England. Lander's *Imaginary Conversations* also are a happy effort of this kind. When dialogue is combined with action, we have the drama. On the ancient dialogue, consult: Reid, edition of the *Academica* of Cicero, p. 25 (London, 1885); Hirzel, *Der Dialog* (Leipzig, 1895); Christ, *Geschichte der griechischen Literatur*, vol. i, pp. 621 (5th ed., Munich, 1908).

**DIALOGUE OF DEATH.** A religious work by William Bullen, written and published during the London Plague (1664-65).

**DIAMAGNETISM** (from Gk. *διά*, *dia*, through + *μάγνης*, *magnēs*, magnet, from *Μάγνης*, *Magnēs*, Magnesian, from *Μαγνησία*, *Magnēsia*, a city of Thessaly, in Greece, where magnetic stones abounded). A name given certain magnetic phenomena observed in the case of bismuth and some other substances. If a small piece of bismuth is brought near one pole of a strong magnet, it will be seen to be repelled. This is owing to two things: (1) the magnetic field at the end of the magnet is not uniform, being strong near the magnet and feeble at a distance; (2) the surrounding medium is air. If the field of magnetic force were uniform, there would be neither repulsion nor attraction, the piece of bismuth would simply turn and take up a definite position. Further, Faraday has shown that the question of attraction or repulsion depends not on the body itself, but on its magnetic properties with reference to those of the surrounding mediums. (See MAGNETISM.) Faraday showed that the following substances and a few others were diamagnetic when placed in air: bismuth, antimony, tin, zinc, cadmium, mercury, silver, copper, gold, lead, sulphur, sugar, wood, water, alcohol.

**DIAMANTE**, dè'a-mān'tā, JUAN BAUTISTA (fl. last half of the seventeenth century). A Spanish dramatist. He was born in Madrid, but at what date we do not know; 1626, 1630, and 1640 all have been suggested with queries, probability pointing to c.1630. In his native city about one-half of the 50 plays written by him and still extant were published in book form (2 vols., 1670 and 1679). His earliest surviving work is the tragedy entitled *El honorador de su padre* (1658), a free rendering of Corneille's *Cid*. Among the other pieces attributed to him *La judía de Toledo* has probably enjoyed the greatest popularity, but modern scholarship deprives him of the chief credit concerning this play by showing that it is probably only a slight reworking of Mira de Mezcua's *La desgraciada Raquel*, with a different name. He was a knight of St. John of Jerusalem and probably, like Calderón, Lope de Vega, and several other celebrated poets, spent the closing years of his life in the midst of his brotherhood. The date of his death is not known, but we have no mention of him as a

living author after 1684. Consult: H. A. Rennert, "Mira de Mesuca et 'La Judía de Toledo,'" in *Revue Hispanique*, vol. vii (Paris, 1900); A. L. A. Fée, *Études sur l'ancien théâtre espagnol: Les trois Cid* (ib., 1873); and for four of Diamante's plays, vol. xlix of the *Biblioteca de autores españoles*.

**DIAMANTINA**, dē'-mān-tē'nā. An episcopal city in the State of Minas Geraes, Brazil, situated 146 miles northeast of Ouro Preto and 3710 feet above sea level (Map: Brazil, J 7). It has an episcopal seminary and numerous public buildings. It is the centre of a diamond-producing district, and has diamond-cutting and goldsmiths' establishments, as well as cotton and leather manufactures, and a trade in diamonds amounting almost to \$1,000,000 annually. Diamantina was founded in 1730. It formerly bore the name Tejuco. Pop., 1890, 17,980; 1905, est., 14,000.

**DIA'MENIA**. A genus of elapine venomous snakes of Australia. See GRAY SNAKE.

**DIAMETER** (Lat. *diametros*, from Gk. *día-mētros*, diameter, from *día*, *día*, through + *mētros*, *metron*, measure). A diameter of a conic section (q.v.) is any chord which connects the points of contact of parallel tangents. In the circle, ellipse, and hyperbola all diameters pass through the centre (see CURVE) and are bisected by it. Only the circle has all diameters equal, and each bisects the chords perpendicular to it. In the ellipse only the diameters called the minor and major axis bisect the chords perpendicular to them. In the parabola all diameters are parallel to the axis. (For conjugate diameters, see CONJUGATE.) Certain solid bodies also have diameters. In the sphere and the ellipsoid the lines passing through the centre are called diameters and are bisected by the centre. See AXIS.

**DY'AMOND** (OF., Fr. *diamant*, It. Sp. *diamante*, from Lat. *adamas*, adamant, diamond, from Gk. *adámas*, *adamas*, adamant, from *á*, a priv. + *δάμαρ*, *daman*, Skt. *dam*, to subdue). A precious stone composed of pure carbon, remarkable for hardness, lustre, and flash of color. It crystallizes in the isometric system, usually in octahedrons, or in combinations of several forms, including the octahedron, cube, rhombic dodecahedron, trisoctahedron, and hexoctahedron; the faces and edges of the crystals frequently are curved. It has a very perfect cleavage by which the primary form of the octahedron may be derived. The diamond is not acted upon by acids or alkalis, but if heated to a high temperature in the presence of oxygen it burns to carbon dioxide. Its brilliant lustre and display of prismatic colors are due to the property of refracting and dispersing the light rays, a property possessed in the highest degree by colorless stones. The specific gravity of the diamond is 3.52; its hardness, which is assumed to be 10 on the mineral scale, exceeds that of any other known substance. By friction it becomes phosphorescent and positively electric. The diamond has a great variety of natural colorings; white, yellow, and brown specimens are the most common, but pure white and fine shades of brown and yellow are quite rare and command high prices. Red in rich, deep tints is perhaps the most prized of all colors, while blue and green are also highly valued owing to their beauty and rarity. The amorphous steel-gray to black diamond, known as "bort" or "carbonado," which is unsuitable for gems, is ex-

tensively used on the cutting edge of drills for tunneling and prospecting.

**Occurrence.** Previous to the discovery of the Brazilian mines in 1727, diamonds were found chiefly in India and Borneo. In India they have been obtained near Kadapa, Karnul, and Bellari in Madras Presidency; near Nagpur, in the Central Provinces; and at Panna, in Bundelkhand. The famous Golconda was a market in Madras Presidency where the diamonds were collected from the mines. Formerly the diamond-mining industry gave employment to a large number of people, but, owing to the gradual exhaustion of the deposits and the crude methods of working, it has steadily declined. The diamond mines of Borneo, which supply about 3000 carats annually, are located in the western part of the island near Pontianak. The Brazilian diamonds come from a small district within the states of Bahia, Minas Geraes, Goyaz, and Matto Grosso, being found for the most part in placers. Diamantina, Bagagem, and Abaete in Minas Geraes are the principal localities for gem stones, and Lençoes, Sincora, and Santo Ignacio for carbonados. The alluvial deposits consist of water-worn quartz pebbles, and ferruginous clay, carrying rutile, hematite, ilmenite, and other minerals besides the diamonds. In one locality (Bagagem) the stones are found in a weathered, decomposed phyllite; they are also known to occur elsewhere in conglomerate. The total output of the Brazilian mines up to the year 1899 has been estimated by one authority at 13,105,000 carats. The most valuable specimen from this source is the "Southern Star," found in 1854, which weighed 254 carats in the rough and 124 carats after cutting.

The South African diamond fields yield about 98 per cent of the total product. Their discovery in 1867 came from the purchase of a stone that had been picked up by the children of a Boer farmer, and which was subsequently sold in Paris for \$2500. The diamonds are found in both river diggings and dry diggings. River diggings occur along the Vaal River from Potchefstroom down to the confluence with the Orange and up the latter river as far as Hope-town. Mining is conducted in a similar manner to gold washing, the operations usually being on a limited scale. The dry diggings are in Griqualand West, on the borders of the Orange River Colony, about 640 miles northeast of Cape Town. They comprise a number of small areas of circular or oval form, ranging in diameter up to ¼ of a mile. They are worked by a single company, the De Beers Consolidated Mines, Limited. The mines are opened on a large scale and yield enormous profits. It is stated that the output from 1867 to 1897 was over 33,000,000 carats, or about 7½ tons, valued after cutting at \$450,000,000. Quite recently another diamond field has been opened in Transvaal, near Pretoria. The largest mine is the Premier, which has been proved to be very rich. The South African diamonds in the average do not equal the Brazilian for purity, although some of the most valuable stones, remarkable for quality as well as for size, have been found in these mines. Other countries where diamonds are known to occur are the United States, British Guiana, Russia, China, Sumatra, and Australia. In the United States there are no deposits, so far as discovered, of sufficient value to warrant mining operations,

## THE CULLINAN DIAMOND

No. 1. CULLINAN DIAMOND. Stone before cutting (natural size).  
 Nos. 2 to 10. THE NINE LARGEST STONES WHICH WERE CUT FROM No. 1 (natural size).  
 No. 9. THE PENDANT SHAPED BRILLIANT KNOWN AS CULLINAN I WEIGHING 516 1/2 KARATS. THIS IS

mier mine near Pretoria, Transvaal. The stone—called the Cullinan diamond from the name of its finder—weighed 3024½ carats, or 1.37 pounds, and measured 4 inches by 2.5 inches by 1.25 inches. It shows five cleavage planes, indicating that it is only a portion of a large crystal. The color is reputed to be the purest of any of the large stones. Its value has been estimated at from \$2,500,000 to \$5,000,000. This diamond was purchased by an English syndicate and has been cut into nine stones, which were presented in 1908 to King Edward VII to be placed among the English crown jewels. The largest of these, a pendent-shaped brilliant weighing 516½ carats, is mounted in a removable setting in the sceptre. It is known as Cullinan I. The second largest stone, Cullinan II, weighs 309 ⅓ carats and is mounted in the crown of England.

**Diamond Cutting.** The art of diamond cutting was not developed until the middle of the fifteenth century, although crude methods of polishing were in use long before that time. About 1470 a guild of lapidaries was established at Bruges, under the direction of Louis de Berquem, who is thought to have been the first to devise a regular plan for the arrangement of facets so as to increase the color effects in gems. Other guilds were soon founded in Antwerp and Amsterdam, and these cities rapidly gained preëminence in the industry—a position they still maintain.

In diamond cutting the operations are performed with the single object of producing the most valuable gem from a crude stone. The apparatus used is simple, but its manipulation requires both skill and experience. In the first place the stone must be examined carefully to determine its shape, color, and the possible pres-

ence of flaws, as these features will govern the operation of cutting. If the shape is such that it cannot be reduced readily to one of the usual forms, the stone may be divided into two or more parts by taking advantage of the natural cleavage. The diamond is cemented to a wooden holder, and a steel blade is applied in a direction parallel to an octahedral face. A sharp blow upon the back of the blade is sufficient to accomplish the cleaving. The next process (bruting) brings out the facets. Two rough stones, fixed at the end of holders, are held in either hand of the operator, who presses them against each other, at the same time giving them a rubbing motion. The friction wears away the surfaces gradually until they coincide in position to two of the facets. The diamonds are then cemented in new positions, and the operation is continued. The waste particles of dust are collected and used in the final process of polishing. For this the apparatus consists of a small disk of spongy cast-iron, turning on a vertical spindle at a speed of 2000 to 3000 revolutions per minute. The stone, imbedded in the apex of a metallic (lead-tin) cone, is held by a clamp against the surface of the disk, which is smeared from time to time with a mixture of olive oil and diamond dust. This operation requires constant attention, as the stone may be permanently damaged by overheating.

Of the several forms in which diamonds are cut, the *brilliant* is the favorite. It is derived from the fundamental octahedron and requires, when perfect, 58 facets. In the middle is an octagonal facet called the "table," which is surrounded by 32 smaller facets, reaching to the line of union (girdle) between the upper and lower portions. On the lower portion there are 24 facets symmetrically arranged around the "culet." The *rose* form is used for thin stones. It consists of a number of triangular facets, the apices of which meet in the crown, and whose bases are supported by a second row of facets extending to the girdle. The lower part is perfectly flat. In the *briolette* the stone is cut into triangular facets, but the form is pear-shaped and there is no girdle.

**DIAMOND, CAPE.** See CAPE DIAMOND.

**DIAMOND-BACK.** See TERRAPIN.

**DIAMOND BEETLE.** The common name of a South American weevil (*Entimus imperialis*), so named because of its brilliant coloration. It is an inch or more in length, with a black surface covered with punctures lined with oval scales that reflect such a brilliant green that the entire elytra appear green instead of black. The color changes with varying reflected light and is purely optical and not due at all to any pigment.

**DIAMOND BIRD** (so called from the peculiar marks on the plumage). A small insectivorous bird of the Australian genus *Pardolotus*, of uncertain affinities, but allied to the honey suckers (q.v.) and by some placed in the Dicaeidae. (See DICAUM). The commonest species is the well-known *Pardolotus affinis*. "It

would be in vain" says Wheelwright, in *Bush Wanderings* (London, 1865), "to attempt to do justice . . . to the varied and beautiful plumage of this handsome little bird. The general color is ashy gray and white, but spotted and spangled all over with red, yellow, orange, and black, and the tail coverts dark red." It is migratory, frequent in summer the open gum forests of southern Australia, especially about the honeysuckles and other tree flowers; has a loud, sweet call note; and breeds in holes in old logs and sometimes in the ground. Consult Campbell, *Nests and Eggs of Australian Birds* (Sheffield, 1900).

**DIAMOND NECKLACE, THE AFFAIR OF THE.** A celebrated scandal involving the royal family of France in the years preceding the outbreak of the French Revolution. The affair has remained a puzzling incident in the history of the French court, in spite of time and a fairly generous literature. It revolves about a magnificent collar of diamonds which Messrs. Boehmer and Bassange, jewelers to the French court, had brought together at vast expense for Madame du Barry, mistress of Louis XV. The King, however, died before the necklace was completed. Towards the end of 1784 Boehmer and Bassange attempted to induce Marie Antoinette to purchase the necklace, through the efforts of an intermediary, a certain Countess Lamotte-Valois, a friend of the Queen. For some time before this the Countess had been acting as the agent in a remarkable intrigue revolving about Cardinal Rohan, Grand Almoner of France and Bishop of Strassburg, who, previous to 1774, had been Ambassador at Vienna and had been recalled in disgrace. Hoping to regain power through the favor of the Queen, this good-natured libertine, generous, vain, and easily imposed upon, fell a victim to the cunning of the Countess, who persuaded him that Marie Antoinette was inclined to look with favor upon him. A remarkable correspondence ensued, in which Rohan's hopes were fed by letters purporting to come from the Queen, but in reality written by the Countess. In July, 1784, the Cardinal was made to believe that the Queen had consented to give him a private audience. A woman of the streets, a certain Mademoiselle Oliva, in form and general cast of features remarkably resembling Marie Antoinette, was hired to impersonate the Queen. A brief interview in the park of Versailles at midnight served to keep up the prelate's ardor, and his gratitude showed itself in substantial favors to the Countess.

When Boehmer and Bassange sought her services with the Queen, the Countess probably conceived the idea of uniting the two enterprises into one profitable undertaking. In January, 1785, she informed Bassange that the Queen was willing to purchase the collar, but she made it a condition that the negotiations must be carried on through a third person. Rohan was designated as the one from whom the jewelers were to take their surties as to payment. The Cardinal, who had been persuaded that his services in the matter would insure his success with the Queen, agreed to pay 1,600,000 livres for the necklace in four installments, beginning with August 1. On January 29 the jewelers signed a contract of sale, and on the 31st the instrument was returned to them signed "Marie Antoinette de France." This is generally brought forward as a proof against the genuineness of the signa-

ture, inasmuch as the Queen was accustomed to sign herself "Marie Antoinette d'Autriche." On February 1, at Versailles, in the presence of Rohan, the Countess delivered a casket containing the necklace to Desclaux, an attendant of the Queen, after the smaller stones and pendants had been removed for the purpose of securing the money necessary for the payment of the first installment. This is the version given by the Countess in her *Memoirs* and is accepted by Michelet. Whether the account be true or false, nothing more was ever seen of the collar as a whole. The failure of Rohan to pay on August 1 led the jewelers to complain to Breteuil, Minister of Police, who, as an enemy of Rohan, rejoiced exceedingly and informed the Queen of the scandalous reports which were being circulated in Paris concerning the Cardinal and herself. The affair was quickly brought to the notice of the King, upon whom it produced an extremely painful impression. On August 15, Ascension Day, the Cardinal Rohan, in full pontifical robes, was arrested in the midst of the court and sent to the Bastille. The Countess was arrested three days later, and this was followed by the imprisonment of the wonder-working magician Cagliostro (q.v.), who had been Rohan's chief adviser in the affair, as well as of Lamotte's lover. The Parlement of Paris was charged with the trial of the case, which, however, was conducted in a half-hearted manner, for it would seem that the King, fearing the odium which a full revelation might bring upon the Queen, prevented in a large measure an impartial investigation. On May 3, the Countess was found guilty of the theft of the necklace and was sentenced to be scourged, branded, and imprisoned for life. Her husband, who had succeeded in avoiding arrest, was condemned to the galleys as her accomplice. Rohan and Cagliostro were found guilty of criminal intent, and the Cardinal was declared an innocent dupe. The Countess succeeded in escaping from prison, and took up her residence in London, where she died miserably in 1791. Consult Funck-Bretano, *The Diamond Necklace* (New York, 1901).

**DIAMOND BATTLESNAKE.** See RATTLE-SNAKE.

**DIAMOND SNAKE** (so called from the diamond-shaped marks on its skin). 1. An Australian python, or rock snake (*Python spilosis*), which was long regarded as one of the two species of the genus *Morelia*, the other being the so-called carpet snake (*Morelia variegata*). The two are now considered varieties of a single highly variable species of true python, the richly colored variety called diamond snake being especially abundant in Victoria, while the so-called carpet snake is widely scattered throughout Australia. It is about 6 feet long, of rather heavy form, and inhabits nearly every region that offers shelter, though stony ridges supplied with trees and well watered seem to be its favorite haunt. Its food consists of small mammals, birds, and birds' eggs and young, and it frequently raids the poultry yards of the farmers. Though able to bite severely when irritated, it is not poisonous. It makes a sort of nest of dry grass or other soft materials within a hollow log, or similar place, and lays its eggs in a pile, which it guards. The colors vary from glossy black with bright yellow spots, one on each scale and forming an arrangement of lozenge-shaped markings, with the abdomen yellow and black, as in the true diamond snake, to the greenish,

irregularly marked coloration of the carpet variety.

2. In Tasmania, a local venomous serpent (*Holoccephalus superbus*). See DEATH ADDER.

**DIAMOND STATE**, THE. Delaware. See STATES, POPULAR NAMES OF.

**DIAMOND WEDDING**. See WEDDING ANNIVERSARIES.

**DIANA**. A Roman goddess, identified by the Romans with the Greek Artemis. According to the common myths, Artemis, as daughter of Zeus and Leto, was the twin sister of Apollo and was therefore worshiped with him at Delos, Miletus, and many other places. There seems good reason for believing that this connection with Apollo is one of the later developments of the worship of Artemis. It exercised in time a powerful influence on literature, art, and religion. To this aspect of Artemis belongs the conception of her virgin purity—a quality which she was supposed to require strictly from others, especially from her priests and priestesses. From the fifth century B.C. Artemis is frequently identified by the poets with Selene, the moon goddess, and with Hecate. The Roman Diana, it may be noted here, was probably originally a deity of the sky, of light (her name would seem to be connected with the Latin adjective *dius*, 'heavenly, divine,' which yields the noun *dium*, 'heaven,' seen in the phrase *sub dio* 'under the skies'). Still later Artemis was connected with numerous foreign deities, in whose worship the Greeks thought they found kindred rites. Such were the Persian Anaitis from the Oxus, the Thracian Bendis, the Cretan Britomartis or Dictynna, the goddess of the Tauric Chersonese (the Crimea), who was worshiped with human sacrifices (see IPHIGENIA, ORESTES), and, above all, the great nature goddess who was the chief deity of Ephesus, where her temple was the wonder of the world. (See DIANA, TEMPLE OF.) In archaic art Artemis often appears as winged and grasping two lions or other wild animals, the so-called "Persian Artemis"; but later the prevailing type is that of the huntress, with high-girded tunic, armed with bow and quiver, and sometimes grasping a deer. She also appears in long, flowing robes. As Selene, she wears the crescent moon on her forehead. The Romans identified with the Greek Artemis their Italian goddess Diana, who was also a nature goddess. As Noctiluca ('Giving Light by Night'), she had a shrine on the Palatine in which lights burned throughout the night. Her worship was rapidly Hellenized, but the native cult in the grove at Nemi (q.v.) was long preserved. The distinguishing feature of this sanctuary was that the priest must win his position by killing his predecessor; as a result of this requirement this place was in historic times filled with runaway slaves. Consult Frazer, *Golden Bough* (parts i-iii, 2d ed., London, 1911). This custom was perhaps a survival from a time when human sacrifices were offered to Diana. At Nemi Diana was worshiped together with a deity called Virbius, who was identified with Hippolytus (q.v.), the son of Theseus.

The worship of Diana was early transferred from Latium to Rome; her great temple on the Aventine was built, so tradition said, by the Latins and the Romans conjointly. For the ceremonies connected with this temple and for the special reverence in which Diana was held by the plebeians at Rome, consult Fowler, *Roman Festivals* (London, 1899).

The conception of this goddess is singularly devoid of unity, and there is much in the legends and cults which suggests the union under a common name of originally diverse local divinities. Even the Greek name is still unexplained. In many phases of her cult Artemis appears as a nature goddess, as bringing fruitfulness, and as worshiped on mountains and in meadows or sacred groves, or even as connected with the swamps and streams or with husbandry. More prominent in the literature and art is the conception of Artemis as ruler and guardian of the animal world, not merely of deer, boar, and other wild creatures, but also of domestic cattle, for the bull is one of her chosen victims, and the bucolic poetry of the shepherds is said to have arisen at her festivals. Artemis (sometimes directly identified with Eileithyia) was supposed to protect women in childbirth; she also watched over the growth of children. To her they offered their hair on attaining maturity, and to her maidens, before marriage, dedicated their toys, dolls, and garments. But Artemis does not always appear as the friendly deity. She is also a goddess of death, especially in the case of women, whom she slays with her gentle arrows as Apollo does men. In this aspect she demanded human sacrifices, and there are numerous traces of such bloody rites in such Greek legends as that of Iphigenia and in later symbolism. See BRAURONIA; MYTH; MYTHOLOGY. Consult: Farnell, *Cults of the Greek States*, vol. ii (Oxford, 1896); Fairbanks, *Greek Religion* (New York, 1910); Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

**DIANA, TEMPLE OF**. A magnificent structure at Ephesus, built at the public charge and regarded as one of the seven wonders of the world. From the eighth century B.C. the site was the seat of the worship of the Asiatic nature goddess, whom the Greeks identified with Artemis (see DIANA); legend told of many temples burned before the Ephesians, at the close of the seventh or the beginning of the sixth century B.C., began the erection of a series of famous temples to Artemis. Of the first of these Cheraiphron, of Cnossus, was the chief architect, and the work was continued by his son Metagenes. In the time of Cræsus (q.v.) a much larger temple, known now as the Archaic Temple or the Cræsus Temple, was begun (c.550 B.C.). This temple was laid bare by Wood in 1869-74. (See below.) It seems to have had two rows of eight columns across the front and the rear, and two rows of 20 columns on each side (in this statement the corner columns have been counted twice). According to Pliny, 120 years elapsed before it was completed, but this statement has been challenged, on the ground that the sculptured bases of the columns and the frieze and cornice belong to the same era, the time of King Cræsus, who contributed largely to the building. This temple was burned in 356 B.C. by a certain Herostratus, who wished to immortalize himself; the myth mongers asserted that the fire occurred on the night when Alexander the Great was born. The fire seems to have destroyed only a part of the temple, and its reconstruction was at once begun, under the direction of Dinocrates (q.v.). It was this structure that came to be regarded as one of the wonders of the world; its columns, of great diameter, were over 60 feet high. This temple, known as the Hellenistic Temple, seems to have been plundered and perhaps burned by the Goths in 262 A.D. The

emple was, however, restored, and lasted till Theodosius (q.v.) closed by an edict the pagan temples. Its stones were then used in the building of a great cathedral of St. John on a hill near by. Of these structures, some remains were found by J. T. Wood, who conducted excavations at Ephesus from 1863 to 1874, though not till Dec. 31, 1869, was the true site determined. In 1904-05 D. G. Hogarth, under commission from the British Museum, reexamined the site. Beneath Wood's earliest temple he found remains of three earlier shrines and a rich array of offerings belonging to the earliest sanctuary; these offerings, which included many fine objects of Hellenic workmanship, among them the earliest-known coins of electrum (q.v.), prove that here was a sanctuary on this site long before the time of Cræsus. Sculptures and fragments of the architecture of the various temples are now in the British Museum; so too is part of the treasure found by Hogarth. In the temple were many fine works of art, e.g., statues of Amazons by Phidias, Polyclitus, Cressilas, and Phradmon, and a painting by Apelles which represented Alexander the Great as holding a thunderbolt. The temple also had a famous right of asylum, which continued down at least to the days of Tiberius. Consult: Wood, *Discoveries at Ephesus* (London, 1877); Ferguson, "The Temple of Diana at Ephesus," in *Transactions of Royal Institute of British Architects* (ib., 1883); Murray, "Sculptured Columns of the Temple of Diana at Ephesus," in *Journal of the Royal Institute of British Architects* (ib., 1895); Hogarth, *Excavations at Ephesus: The Archaic Artemisia* (2 vols., ib., 1908).

**DIANA ENAMORADA**, *dê-nâ a-nâ-mô-râ-nâ* (Sp., Enamored Diana). An extremely popular pastoral romance, by Jorge de Montemayor, first printed at Valencia in 1542, left incomplete, and finished in 1564 by Antonio Perez, of Salamanca.

**DIANA MONKEY**. A well-known monkey (*Cercopithecus*, or *Lanopygga, diana*) of the west coast of Africa, which takes its name from a crescent of upstanding white hair on the forehead. Its general color is black, with the ridge of the back and the rump bay color, sharply defined and strikingly set off by the pure white of all the fore parts, including a long beard. Like its congener, the Mona monkey, this guenon (q.v.) is gentle and easily tamed when young, but it is rarely seen in menageries on account of its delicacy. See PLATE of MONKEYS of THE OLD WORLD.

**DIANE DE FRANCE**, *dê-an' de frâns*, DUCHESSE DE MONTMORENCY ET D'ANGOULÊME (1538-1619). A French lady, born in Piedmont. Her father was Henry II of France and her mother, Philippa Duca, a low-born Piedmontese of great beauty, whom he met during the campaign in Italy (1537). Diane was educated in France and solemnly legitimized and always afterward signed herself Diane de France. She was the favorite daughter of her father and was married with much pomp to Orazio Farnese, Duc de Castro, second son of the Duke of Parma (1553). Six months later this prince was killed by the Spanish at Hesdin. Four years afterward Diane was married to François de Montmorency. Upon his death she declined to enter again into matrimony and turned her attention to pious deeds and the delicate rôle of mediator in the differences between the members of her family. Thus she brought about the important reconcili-

ation of Henry III with Henry of Navarre. Her gentleness and real goodness, in a time so corrupt, made her honored by all. She is one of the most agreeable figures in that period of French history.

**DIANE DE POITIERS**, *dê-an' de pwâ'tyâ'* (1499-1566). Duchess of Valentinois and mistress of Henry II of France. When but 13 years of age, she was married to the Count of Maulevrier, Grand Seneschal of Normandy, by whom she had two daughters. She was a widow at 32, and some seven years later became the mistress of Henry (then dauphin), who was but 18 years old. At that time the Duchesse d'Etampes was the favorite of Francis I, and the two women ruled the court; but when Henry became King, Diane was the real ruler and at once sent her rival into exile. Notwithstanding the beauty and the rights of his wife, Catharine de' Medici, Henry was controlled by Diane during his whole reign. At the death of Henry, however, Catharine de' Medici recovered her position and pursued her rival with considerable vindictiveness. Diane retired into obscurity, and died in 1566.

**DIANTUM**. See DENIA.

**DIANO MARINA**, *dê-nô mâ-rê-nâ*. A winter resort, on the Ligurian Sea, in the Province of Porto Maurizio, northwest Italy, 20 miles east of San Remo and just adjoining the Riviera (Map: Italy, C 4). It was partly destroyed by the earthquake of February, 1887, but has since been rebuilt. Its chief trade is in olive oil. Pop. (commune), 1901, 1859; 1911, 1929.

**DIANOBA**, *dê-a-nô-râ*. The wife of Gilberto in the fifth story of the tenth day in Boccaccio's *Decameron*. The story is the source of Chaucer's *Franklyn's Tale*.

**DIANTHUS**. See CARNATION; PINK.

**DIAPASOŒN** (Lat., octave, from Gk. *διαπασών*, *diapasōn*, through all, ec. *χορδών*, *chor-dōn*, chords). A term in music by which the ancient Greeks designated the octave. In modern music diapason is used to denote the range or compass of the voice or of an instrument. The French used the term as equivalent to "pitch." The diapason normal is the standard or international pitch which is now almost universally adopted. The French Academy, in 1859, fixed the number of vibrations of the *a'* at 870 (or 435 double vibrations) per second. Diapason is also the English name given to certain stops of pipes in the organ, commonly of eight-foot pitch, which are considered the fundamental stops, of which there are generally two—a stopped diapason and an open diapason—on each manual. See ORGAN.

**DIAPER** (OF. *diapre*, *diaspre*, It. *diaspro*, from Lat. *jaspis*, Gk. *ἱάσπρις*, *iaspis*, jasper, possibly of Semitic origin; cf. Heb. *yashphêl*, Ar. *yashb*, *yashf*, *yashb*, jasper). A term in decoration derived from the early mediæval practice of incrusting jewels (jasper) in metal work, filigree, and even textile fabrics. It is now used to designate any all-over patterning in which an ornamental unit is repeated or inclosed in each mesh of a network of intersecting lines. The more common types of diaper consist of two systems of intersecting lines forming a quarry (q.v.) of diamond-shaped meshes with a simple flower or rosette or like motive repeated in each. The origin of diaper patterning is to be sought in the basketry and grass weaving of primitive tribes. So soon as decorative patterns begin to be generated by the interweaving of grasses of

different colors, zigzags and quarries begin to appear in primitive design, followed by quarries with central ornaments forming diapers. Patterns of this sort have continued to be used in the textile art of all ages. They early passed from textile art to other fields of design. In the Middle Ages, especially, diapers abounded, both in Christian and Mohammedan art. The shafts of Romanesque and Norman columns (e.g., Saint-Denis in France) and in Gothic art, especially in England, the spandrels of arcades (e.g., Westminster Abbey) were often adorned with diapers in very flat relief. The Moslem artists of the Middle Ages, especially those of Spain, developed extraordinary systems of intricate surface decoration of walls in color, in which diapers played an important part; the framework or mesh, however, being composed, not of straight lines, but of a species of vine pattern forming meshes of complex shapes in which appeared portions of a running ornament on a lower plane, as in the Alhambra (q.v.). (See MOHAMMEDAN ART.) Diaper patterns are common in modern art on wall papers, carpets, oilcloths, mosaic and pavement decorations, and textile fabrics. In heraldry the term is applied to fields and charges, relieved by arabesque and geometrical patterns. These patterns were generally of a darker shade of the same tincture. This, being merely an ornamental device, not affecting the heraldic value of the objects to which it was applied, was generally left to the fancy of the printer.

**DIAPHANOSCOPE** (Gk. *διαφανής*, *diaphanēs*, transparent + *σκοπεῖν*, *skopein*, to see). A dark box, constructed for exhibiting transparent photographs or other pictures. It may or may not be furnished with a lens. The photograph, which is generally a glass positive, is placed at a distance from the eye equivalent to the focal length of the lens with which the original picture was made.

**DIAPHORESIS** (Lat., from Gk. *διαφύρεσις*, perspiration, from *διαφορεῖν*, *diaphorein*, to carry off, from *δια*, *dia*, through + *φορεῖν*, *phorein*, to carry, frequentative of *φέρειν*, *pherein*, to bear). The excretion of sweat or perspiration, whether perceptible or not. The term is generally used to denote the excessive perspiration caused by certain drugs called diaphoretics (q.v.) or sudorifics.

**DIAPHORETICS** (Gk. *διαφορητικὸς*, *diaphoretikos*, promoting perspiration, from *διαφορεῖν*, *diaphorein*, to carry off). Remedies used to excite the secretions of the skin. When acting very powerfully, they are called sudorifics. The simplest diaphoretic agents are baths, which may be either warm baths of water or vapor baths, and may be either simple or medicated. (See BATH.) The most powerful of all, however, as regards inducing perspiration, is probably the so-called Turkish bath, which consists essentially in the use of air heated to a temperature of 140° F., or even more. Diaphoretic drugs may act either by stimulating the sweat centres in the spinal cord, or the nerves proceeding from them to the glands, or on the terminations of these nerves in the glands; or they may stimulate the glandular cells directly. The following substances, used internally, are powerful diaphoretics: antimony, Dover's powder (ipecacuanha and opium), ammonia, and the carbonate, or acetate, of ammonia (spirit of Mindererus), sweet spirits of nitre, pilocarpine, camphor, and alcohol.

**DIAPHRAGM**, *dī'-ā-frām* (Lat., *diaphragma*, Gk. *διάφραγμα*, partition, midriff, from *διαφραγνέω*, *diaphraggnēnai*, to barricade, from *δια*, *dia*, through + *φραγνέω*, *phraggnēnai*, to fence in). A thin musculo-fibrous partition separating the cavity of the thorax from that of the abdomen. It is roughly elliptical, with the longest diameter from side to side and almost horizontal in its anterior part, while the posterior portion is nearly vertical. The diaphragm is attached in front to the ensiform cartilage of the breast-bone (sternum) and laterally to the inner surface of the cartilages and bony parts of the six or seven lower ribs; posteriorly the attachment is to two aponeurotic arches on each side (*ligamentum arcuatum externum and internum*), and to the second, third, and fourth lumbar vertebrae by means of firm fibrous tendons (the *crura* of the diaphragm), which terminate above in large fleshy bellies. The central portion of the diaphragm is tendinous and shaped like a trefoil leaf, the muscular fibres radiating from this to the points of attachment. There are three large and several smaller openings in the diaphragm. Through the former pass the abdominal aorta, the vena azygos major, the thoracic duct, the esophagus, pneumogastric nerves, and vena cava. The diaphragm is convex above and is in relation with the pleurae of the lungs and pericardium; while its concave dome is invested by the peritoneal lining of the abdomen. During respiration the height of the diaphragm constantly changes; it descends during inspiration and thus increases the capacity of the thorax, so that air rushes in to fill the vacuum formed. This contraction of the diaphragm also raises the ribs and widens the chest laterally. In expiration the diaphragm returns to its former position. The descent of the diaphragm encroaches upon the abdomen and lessens its capacity. In all expulsive acts the diaphragm by its contractions gives increased power to the effort and is accordingly an important factor in sneezing, coughing, laughing, and crying, as well as in the expulsion of urine and feces. Hiccoughing is due to spasmodic contraction of the diaphragm.

**DIAPHRAGM**. A partition with a hole in it, employed not only in landscape and portrait lenses for photography, but also in telescopes, microscopes, and other optical instruments, for the purpose of cutting off the superfluous rays of light, and producing greater intensity or sharpness of the image by decreasing the amount of spherical aberration. (See ABERRATION, SPHERICAL.) The diaphragm only permits those rays to pass which go through the central portion of the lens. The aberration of these rays is much less than those which pass through the lens nearer its circumference. With a photographic lens the diameter of the diaphragm or stop is usually stated in terms of its focal length, as  $\frac{f}{8}$ ,  $\frac{f}{16}$ ,  $\frac{f}{32}$ ,  $\frac{f}{64}$ .

**DIARBEEKIE**, *dā-ār-bēk'ēr*, or **DIARBEEK**, *dē-ār-bēk'ēr* (the land of Bekir). A town of Asiatic Turkey, capital of a vilayet of the same name, situated near the right bank of the Tigris, from which it is separated by extensive gardens (Map: Turkey in Asia, J 4). It is circular in shape, and is surrounded by high, strong walls, flanked with towers and pierced by four gates. The streets are dirty, and the houses for the most part are built of rough stone, plastered with a composition of mud and straw, but some of the better class are of black basalt. It has

over 50 mosques and several Christian churches. Extensive manufactures of silk, cotton, and other goods were at one time carried on at Diarbekir, and the trade between Aleppo and Bagdad contributed greatly to the importance of the town, but the manufactures and trade have now greatly declined. Its present manufactures consist of red and yellow morocco, silk, and copper ware. The region environing the city is rich in minerals, especially copper. Diarbekir occupies the site of the ancient Amida, which was a place of importance in the reign of Constantius, by whom it was strengthened and enlarged. In this reign it was taken by the Persians, from whom it was again captured by the Romans; but in 502 the Persians once more became masters. After many vicissitudes it passed into the hands of Sultan Selim in 1515. Its population is estimated at 38,000, chiefly Mohammedans.

**DIARRHŒA**, *dī'ar-rē'a* (Lat. *diarrhœa*, from Gk. *διάρρœia*, *diarrhœia*, a flowing through, from *διάρρœin*, *diarrhœin*, to flow through, from *διá*, *diá*, through + *ρœin*, *rhœin*, to flow). A symptom of many diseases, consisting in frequent fluid discharges from the bowels. It occurs in catarrhal or inflammatory diseases of the various parts of the bowels, as enteritis, colitis, and duodenitis, in cholera, typhoid fever, Bright's disease, dysentery, and tuberculosis. It is often a temporary affection, due to an effort of nature to remove poisonous or indigestible substances from the intestine. It follows the use of purgative medicines, as is intended. It sometimes occurs in wasting diseases, from the relaxed condition of the blood vessels of the intestines, whereby the water of the blood soaks through and escapes with the feces. A form of nervous diarrhœa is due to suspense or dread; and there is another variety, called morning diarrhœa, occurring in neurasthenic individuals. If the stools contain undigested particles of food, the diarrhœa is termed *lienteric*. Pain, some weakness, and soreness accompany the disorder in most cases. The treatment must be directed, as usual, to removing the cause. If the diarrhœa is caused by indigestibles, a cathartic like castor-oil or rhubarb should be used, and very little simple food should be given for a day afterwards. In other cases carminative and astringent drugs are used, such as ginger, catechu, cardamom, bismuth, chalk, or boiled flour. Opium, lead, iron, capsicum, and camphor are sometimes prescribed. Before using drugs it is, however, necessary to determine, in all but simple cases, whether the diarrhœa is beneficial and therefore should not be checked. See CHOLERA.

**DIARRHŒA**, WHITE, OF CHICKENS. This is probably the most destructive disease of chickens with which the poultryman has to deal, the loss varying in different years, and placed at from 10 to 90 per cent. Sometimes it is impossible to raise any of the chicks. A good authority states that more than 50 per cent of the chicks hatched throughout the United States are lost from white diarrhœa in its various forms. It is more common among artificially hatched and brooded chicks than among those hatched and cared for by hens. The disease is limited to the first three weeks of the chick's life so far as serious mortality from it is concerned, the heavy loss occurring between the ages of one and three weeks; where the brood is badly affected, the chicks may continue to die until the fourth or fifth week.

The most prominent symptom of the disease is more or less profuse diarrhœa, the droppings consisting almost entirely of mucus from the intestinal tube and the white secretion of the kidney. The affected chicks are first observed to huddle together and remain under the hover or the hen more than young chicks should. Soon they appear listless, stupid, and sleepy—standing or sitting in one position with their eyes closed—few efforts being made to pick up food. Their plumage loses its lustre, the wings droop or project slightly from the body, and the characteristic diarrhœa soon appears. The droppings may be slight or profuse, white or creamy in color, more or less mucilaginous and glairy, and they may be mixed with a brownish material. Often the sticky excrement adheres to the downy feathers about the vent, dries, and continues to accumulate until it completely covers and plugs the opening. This condition, known as "pasting up behind," will, unless soon relieved, bring about an early death of the chick. The diarrhœa results from irritation of the intestines and the increased secretion of mucus, while the large quantity of white material secreted by the kidneys is due to fever and rapid breaking down of the elements of the tissues. Many of the diseased chicks chirp or peep almost constantly; they gradually waste away and become weaker and more emaciated until their legs are scarcely able to support their bodies.

There appear to be two principal causes of this disease—one, referred to as coccidiosis, caused by a protozoan parasite of the genus *Eimeria* (*Coccidium*). The other, known as bacillary white diarrhœa, caused by the *Bacillus pullorum* of Roetger. The *B. pullorum* often infects hens and the eggs which they lay. Such eggs produce chicks which have the germs of the disease within them when they are hatched, and these chicks show symptoms within the first few days of their lives. The bacillus may also be spread from chick to chick through being scattered with the droppings which contaminate the food and drink and cause the appearance of like symptoms when the chicks are from one to two weeks old. Incubators and brooders, as well as coops, become infected and preserve the contagion indefinitely. Adult fowls are resistant and do not show any symptoms when laying infected eggs.

Medicinal treatment of affected chicks has but little effect upon the course of the disease. The feeding of sour milk to chickens appears to be a good means of preventing or at least holding in check epidemics of bacillary white diarrhœa, and it should be fed early and kept before the chicks constantly. Preventive measures should begin with the eggs used for hatching. When purchased, they should be only from flocks known to be healthy. Before placing the eggs in the incubator or under the hen they should be wiped with a cloth wet in grain alcohol of 70 or 80 per cent strength to remove any germs that may be on the surface of the shell. The place should be thoroughly disinfected by saturating the premises with a 5 per cent solution of carbolic acid or a strong solution of a coal-tar disinfectant. The drinking water should be changed frequently and should contain 10 grains of copperas to every gallon, or enough potassium permanganate to give the water a rather deep wine color. Any chicks which sicken should be immediately re-

moved and isolated or killed. For complete elimination of white diarrhoea from a poultry yard it is necessary to reject for breeding purposes stock which harbors the infection and to obtain eggs or live stock from sources where it has not been known to exist.

Consult: Rettger, Kirkpatrick, and Stoneburn, "Bacillary White Diarrhoea of Young Chicks," *Bulletin* 74 (Conn. Storrs Expt. Sta.), and Morse, "White Diarrhoea of Chicks, with Notes on Coccidiosis in Birds," *Circular* 128 (U. S. Dept. Agr., Bur. Anim. Indus.).

**DIARY** (Lat. *diarium*, from *dies*, day). A word which means simply a daily record. It does not, however, as the word is generally used, include every sort of daily record, but rather such as have reference to the writer personally. In it the man of letters inscribes the daily results of observation, reading, thought, or feeling. To the man of affairs it is a chronicle of memorable events, to the physician a register of engagements and professional memoranda, and to men in general a record of what has been of especial interest to them. The usual diary is a book with a separate blank space for each day in the year, these spaces varying in size and form, as the particular bent or profession of the diarist may render necessary. It usually contains some general information and a calendar. Any convenient blank book, however, often serves the purpose. The Greeks had the diary, which they called the *ephemera* (meaning 'of the day'). This word in its plural form, *ephemerides*, has been adopted by some scholars. It is the name that Casaubon gave to the records of his daily studies. The word "journal" is also in use as synonymous with "diary": we have, e.g., the *Journal of Sir Walter Scott*. Diaries have often furnished the historian with invaluable material, supplying the absence of public records, furnishing minute and graphic details of social conditions and the secret springs of public events that are not to be looked for in more formal records, and illuminating the lives and characters of men of mark. Notable among English diaries are those of Pepys and Evelyn (qq.v.).

**DIAS, dē'ash**, GONÇALVES ANTONIO (1823-66). A Brazilian poet, born at Caxias. He was educated at the university of Coimbra, Portugal, and for a time practiced law at Maranhão, Brazil. He was afterward professor of history in the College of Dom Pedro II at Rio de Janeiro. His works include a report, *Brazil e Oceania*; several papers of value on the migrations of the South American Indian tribes; and a number of volumes of poetry, among them the series *Primeiros Cantos* (1846), *Segundos Cantos* (1848), and *Últimos Cantos* (1850).

**DIAS, HENRIQUE** (1600-161). A Brazilian soldier of African blood, born in Pernambuco. He fought with the Portuguese against the Dutch under Gen. Matias de Albuquerque (1633), and did valuable service. He defended Arraial do Bom Jesus and upon its fall was permitted by the Dutch to escape and rejoined the Portuguese army. His brave conduct caused him to be made commander in chief of the negro forces, and he was rewarded with the cross of the Order of Christ. In 1645 he rose against the Spaniards and incited the districts of Sergipe, São Francisco, and Alagoas to revolt. For the next 10 years he fought

continuously, but after the Dutch and independent Spaniards were beaten, Dias was not remembered and promoted with the other generals who fought in Pernambuco. He died in poverty, although his name has always been given to a negro regiment commanded by one of its own race. The date of his death is not known, since nothing is heard of him after his share in the recovery of Arrecifes (1654) and his presence at the capitulation that put an end to the war of 24 years.

**DIAS (dē'as) DE NOVAES, BARTHOLOMEU** (?-1500). A Portuguese navigator and the discoverer of the Cape of Good Hope. He came of a family of famous sailors.—João Dias was associated with Gil Eannes in the voyage of 1434, when Cape Bojador was first doubled, and Diniz Dias was the discoverer of Cape Verde in 1445. In 1478 a BARTHOLOMEU DIAS, presumed to be identical with the subject of this article, made a voyage to Guinea for ivory and slaves. In any case we find that in 1481 he was in command of a vessel sailing to the Gold Coast. Dias was a cavalier of the King's household and superintendent of the royal warehouses when, in October, 1482, King John of Portugal selected him to bear a message to Prester John by sailing around Africa. After several months of preparation Dias sailed for the south in the early summer of 1487 with three vessels. One, a slave vessel, was left at a harbor near the limit of previous exploration, and then Dias began his long voyage along the unknown African coast, to a part of which he gave the expressive name of Hell. Just after New Year's Day, 1488, he was caught by a storm which drove him southward for 13 days, until his crews, fresh from the tropics, began to suffer from the cold. As soon as the storm subsided Dias steered eastward, but, not meeting with land for several days, he turned his prow northward. After sailing 150 leagues he sighted high mountains, and anchored, Feb. 3, 1488, in the modern Mossel Bay, in Cape Colony. Finding that the coast ran east and west, he followed it to Algoa Bay, where the coast began to trend more towards the northeast. Dias proceeded as far as the mouth of the Great Fish River, but was induced by the complaints of his sailors to turn back. It was probably on May 16 that he passed Cape Agulhas, the actual southernmost point of Africa, and a day or two later he saw the striking Table Mountain and the cape which he is commonly said to have named Cabo Tormentoso (Cape of Storms), in memory of the perilous experiences with which it was associated, but which the Portuguese King rechristened Cabo da Boa Esperança, the Cape of Good Hope, though, according to Christopher Columbus, who was present at the royal interview, Dias himself proposed the name. In December Dias reached home, with the news that the point of Africa had been turned, and that the way lay open towards the spice markets of the East. He had added 1200 miles of coast to the knowledge of European sailors and geographers. Between 1490 and 1495 Dias was in command of a vessel engaged in the African trade. When, in 1497, Vasco da Gama was dispatched to complete Dias's discovery of the way to the East, the latter accompanied him as far as the Cape Verde Islands and thence sailed to the Gold Coast to trade. Three years later he commanded one of the ships in Cabral's fleet. Leaving Brazil in

May, 1500, Dias perished in a storm which wrecked his vessel. Consult E. J. Ravenstein, "Voyages of Cão and Dias," in *London Geographical Journal* (1900).

**DIASPORE** (Gk. *diásporá*, *diáspora*, a scattering, from *diásporein*, *diásperein*, to scatter, from *diá*, *dia*, through + *sporein*, *speirein*, to scatter). A hydrated aluminum oxide that crystallizes in the orthorhombic system, is transparent to translucent, and usually white or light gray, though sometimes of a brownish or yellowish color. It occurs with corundum and emery in dolomite and chlorite schist. This mineral is found in granular limestone with emery, in the Ural region, in Hungary, Sweden, Asia Minor, and in the United States at the emery mines of Chester, Mass., where it occurs in large plates in crystals, and is also found with massive corundum near Franklin, Macon Co., N. C.

**DIASTASE** (Gk. *diástasis*, *diastasis*, separation, from *diastáai*, *diastanaí*, to separate, from *diá*, *dia*, apart + *istáai*, *histanai*, to stand). An enzyme, or more likely a group of enzymes, found in both animals and plants, which has the power of converting starch into a sugar. It has also been called amylase, and in the saliva is known as ptyalin. In plants, where it is practically universal, diastase occurs in at least two modifications, viz., secretion diastase and translocation diastase. These differ in their distribution, their mode of action on starch grains and starch paste, the optimum temperature for activity, etc. Translocation diastase is the more widely distributed of the two, being formed by fungi and bacteria, and in leaves, shoots, storage organs, and pollen grains, as well as in the seed. Its function seems to be to make possible the translocations of carbohydrate food, temporarily or permanently stored as starch, by digesting it into a soluble sugar. Translocation diastase is therefore of the utmost importance in plant nutrition. Secretion diastase is formed by special secreting cells in the embryo as well as the aleurone layer of seeds, especially in grasses, and plays its chief rôle in germination by making available the food stored as starch in the seed. Translocation diastase digests and liquefies starch paste slowly, and erodes starch grains uniformly at the surface or in the centre until they disappear. Secretion diastase liquefies starch paste rapidly and corrodes starch grains by forming irregular pits, which, penetrating the grain in various directions, deepen and widen until it falls to pieces. There is some evidence that the secretion diastase of malt consists of at least two enzymes, one hydrolizing starch to dextrine and the other hydrolizing the dextrine to maltose. When heated to 80° C., the dextrine-forming power is still retained, but the maltose-forming power lost.

Diastase cannot be obtained in a pure state; and because its composition has not yet been ascertained, no test for purity can be established. Late work indicates that diastase is a carbohydrate associated with many times its weight of protein as a substrate and impurity. It may be obtained by crushing or grinding the tissue containing it, e.g., malt, and extracting it for 24 hours with three or four times its bulk of water or glycerine. The liquid may be filtered off, and the various substances dissolved along with the diastase may be partially eliminated by adding about three volumes of absolute alco-

hol, collecting on a filter the precipitate formed, washing it with absolute alcohol and ether, and drying. The powder so obtained may be still further purified by solution in water, reprecipitation with alcohol, and dialysis. In the dry state it may be kept indefinitely and retains its digestive power.

The action of diastase on starch is one of hydrolysis, i.e., it causes the starch to combine with water and break up into simpler compounds. The intermediate steps in the process are not known. Diastase readily hydrolizes 80-85 per cent of the starch grain to maltose, while 15 to 20 per cent is very slowly transformed. It appears that the amylose constituent of the grain is the readily hydrolized portion, while the amylopectin is far more resistant. (See STARCH.) Diastase is affected in its rate of action by various reagents. Some accelerate, while others inhibit or entirely stop its action. Very dilute solutions of acids and salts of the lighter metals (sodium chloride, aluminum salts, etc.) and considerable concentration of asparagin belong to the first class; while concentrated solutions of all salts, dilute solutions of salts of the heavy metals, and various organic substances (formaldehyde, etc.) represent the second. Variation of the concentration of certain of these substances in plant organs undoubtedly is of great importance in regulating the rate of diastatic activity. With the exception of formaldehyde, diastase is much more resistant to the action of poisons than is the protoplasm; hence a digesting mixture can be protected from the action of microorganisms without interfering with the action of the diastase. Chloroform and thymol are especially used for this purpose.

Diastase is largely made use of in the manufacture of beer and alcohol, small quantities of the enzyme being capable of effecting the transformation of a considerable amount of starch. A preparation of diastase has of late also been used with some success in the treatment of fermentative dyspepsia. See ALCOHOL; BEER; DEXTIN; ENZYME.

**DIASTROPHISM**. A general term applied to the geological processes which cause the upheaval and subsidence of continental lands and the building of mountain systems. Such processes may result from the strains produced in the earth's crust in adjusting itself to the nucleus or possibly from the shifting of load upon the superstructure by erosion in one place and deposition in another. See GEOLOGY; CONTINENT; MOUNTAIN.

**DIATHERMANCY** (from *diá*, *dia*, through + *thermaios*, *thermantis*, a heating). A term used to express that quality of a body in virtue of which those ether waves are allowed to pass which produce thermal effects to a marked degree. All ether waves carry energy; and in many cases when these waves are absorbed their energy is spent in producing heat effects. (This is not so when the energy of the waves goes to chemical or electrical action.) It is found that in the spectrum of ether waves emitted by any body, e.g., the sun, the energy carried by waves of different wave number is in general different; similarly, the transparency of a body to ether waves varies with their wave number. In discussing diathermancy, therefore, it is necessary to consider both the total radiation transmitted and also the wave numbers of these waves. (See RADIATION.) The greater portion of the energy carried from the sun and from other bodies by

ether waves is associated with waves which do not affect our sense of sight; and other instruments have to be used to detect the waves and measure their energy. Such are thermometers, bolometers, etc. It is possible to have bodies which are absolutely opaque to those waves which affect our eyes and yet are transparent to waves which have a less wave number; and the converse is true. Lamplack, which is opaque to nearly all radiations, has been found to transmit certain heat waves of great length, i.e., small wave number. Ebonite is transparent to long-wave radiations, so that an ebonite prism spreads some of the radiation from a hot body into an invisible heat spectrum, which is quite sensibly detected by a radionimeter. The diathermancy of a body depends upon its temperature and upon its thickness. Consult Tyndall, *Heat as a Mode of Motion* (6th ed., London, 1880).

**DIATHESIS** (Neo-Lat., from Gk. *diathesis*, disposition, from *diartheōnai*, *diatithēsthai*, to dispose, from *diā*, *dia*, apart + *tribēnai*, *tithēnai*, to place). A word applied in medicine to the predisposition or constitution of the body which renders it prone to certain diseased states. Thus the tubercular, scrofulous, gouty, rheumatic, cancerous, or hemorrhagic diatheses are mentioned. A person with gouty diathesis is one in whose case exposure to cold, eating indigestible food in large quantities, or drinking beer causes gouty pains and increased amount of uric acid in the urine; who is likely to have eczema, whose blood is deficient in hemoglobin, and whose arteries are inelastic. The study of diathesis is of great importance, as avoidance of disease through choice of occupation and habits is often possible, if predisposition to disease is recognized.

**DYATOMACEE** (Neo-Lat nom. pl. from Gk. *diatomē*, *diatomē*, severance, from *diatēmein*, to cut through, from *diā*, *dia*, through + *tēmeiv*, *temnein*, to cut). A group of one-

celled, the stalks often branching profusely. The forms of the cells are extremely numerous, one of the most common free-swimming forms being boat-shaped (*Navicula*); there are also rods, wedges, disks, etc.

A special feature of diatoms is the cell wall, which consists of two siliceous valves, one overlapping the other like the two parts of a pill box. This wall forms a complete and resistant skeleton, so that diatoms occur as fossils, often forming large deposits. It has been stated that these siliceous skeletons are falling as a continuous shower from the plankton to the sea bottom. As fossils, they are found especially abundant in the Tertiary period, where the deposits are known as siliceous earths. Such deposits are also abundant in rocks of other ages, and probably diatoms will be recognized in the oldest formations. These deposits constitute an important source of abrasive materials, and the products are known under such names as tripoli, diatomaceous earth (qq.v.), Richmond earth, electro-silicon, kieselsuhr, etc. In many cases the valves are sculptured with fine transverse lines, which are really rows of dots, the markings being so regular and minute as to serve as a test of the definition of microscopic lenses. There is also a longitudinal line which represents a series of openings, through which pseudopodia are thrust for locomotion. The protoplast has a very characteristic structure, the central nucleus being swung in a bridge of cytoplasm, and the characteristic brownish-yellow pigment occurring in two or more plates. The pigment is really due to a mixture of a green constituent (possibly chlorophyll) and a golden-brown constituent called diatomin. In cell division the growth of the protoplast separates the two valves, and, the division occurring in the plane of the valves, each new protoplast possesses one of the old valves and forms a new one on the naked side. It follows that one of the two cells thus produced is of the same size as the parent cell, while the other is smaller, for the small valve of the parent cell becomes the larger valve of the daughter cell. This means that among the progeny there are series of individuals of diminishing size. When this diminution in size has reached a minimum, auxospores are formed, the name meaning "enlarging spores." Auxospores are produced in a variety of ways, the simplest being the separation of the valves and the escape of the protoplast, which in this free condition grows to the maximum size and develops new valves. In other cases the protoplast divides into two daughter protoplasts that escape and enlarge. In still other cases two liberated protoplasts fuse, the product being an auxospore, which behaves as described in the other cases. The relationships of diatoms are very obscure. They seem to stand apart from the other groups of thallophytes. In certain particulars the cell structure suggests that of the desmids (q.v.), while the brown pigment associated with the green suggests brown algae. At present the group is kept apart from others as a distinct assemblage of thallophytes.

**DYATOMACEOUS EARTH** (Ger. *Bergmehl*). This material, often incorrectly called infusorial earth, tripolite or fossil meal, occurs usually in the form of a white or grayish powder of extremely fine texture, less often in consolidated form. When pure, it is composed almost entirely of the indestructible siliceous

DIATOMS.

celled plants commonly known as diatoms. They occur in profusion in fresh and salt water and in damp soil, approximately 6000 species being known. They exist in such numbers in the ocean as to form a large part of the floating plankton (q.v.), a free-swimming and free-floating world of minute organisms. They are solitary or free-swimming forms, or are attached by gelatinous stalks excreted by the

cases of diatoms (see DIATOMACEÆ), but is often more or less impure, due to the presence of clay, sand, or organic matter.

The two following analyses represent the composition of (I) pure earth from California, and (II) impure material from Virginia:

SiO <sub>2</sub>	86.89	63.17
Al <sub>2</sub> O <sub>3</sub>	2.32	19.30
Fe <sub>2</sub> O <sub>3</sub>	1.28	6.32
CaO	.43	.06
MgO	tr.	.69
Alkalies	3.58	3.14
FI <sub>2</sub>	—	.88
H <sub>2</sub> O	4.89	6.39

The earth has accumulated in beds of considerable thickness in the Tertiary formations in some regions, and deposits are now being formed on the bottoms of some fresh-water lakes and on the sea floor. Owing to the angular nature and hardness of its component particles, diatomaceous earth has valuable abrasive properties; it is also employed as an insulating material for boilers and steam-pipe coverings, and mixed with clay for hollow partition blocks. Deposits of diatomaceous earth abound in the Tertiary and Quaternary formations of many countries. In the United States it has been dug in Virginia, Maryland, Connecticut, New York, and in some of the Western States, notably California, where the deposits are several thousand feet thick. The supply far exceeds the demand.

Consult Ries, *Economic Geology* (New York, 1910), and Merrill, *Non-Metallic Minerals* (ib., 1910).

#### DIATOMS. See DIATOMACEÆ.

**DIATONIC SCALE** (Lat. *diatonicus*, from Gk. *διὰ τὸν κλίμα*, *diatonikon*, from *diátonos*, *diatonos*, outstretched, from *diárelvō*, *diatēinō*, to stretch out, from *diá*, *dia*, through + *relvō*, *tēinō*, to stretch; connected with Lat. *tenuis*, Skt. *tanu*, Ger. *dunn*, Eng. *thin*). This scale in music is one in which there are seven notes in the interval of an octave at intervals given by the ratios

$$24 : 27 : 30 : 32 : 36 : 40 : 45$$

Thus, if a note whose frequency is 240 is taken as the keynote, there will be the following notes in the interval of an octave:

$$240, 270, 300, 320, 360, 400, 450,$$

and the octave of 240 will give the frequency, 480. The notes in the lower and upper octaves would then be

$$120, 135, 150, 160, 180, 200, 225, \text{ and } 480, 540, 600, 640, 720, 800, 900, \text{ etc.}$$

It is evident that the ratios of these various notes are the simplest possible. Thus the ratios 1 : 2, 1 : 3, 1 : 4, 2 : 3, 3 : 4, etc., occur. For this reason chords on this scale are in the greatest possible harmony. (See ACOUSTICS.) If, however, music composed with the keynote 240 is transposed to the key 300, the diatonic scale required would be

$$300, \frac{11}{8} \times 300, \frac{5}{4} \times 300, \frac{3}{2} \times 300, \frac{7}{4} \times 300, \text{ etc. ; that is,}$$

$$300, 337\frac{1}{2}, 375, 400, 450, \text{ etc.}$$

But some of these notes do not occur in the original scale with the keynote 240, and for this reason the diatonic scale is unsatisfactory.

Other scales are now used, which include a greater number of notes in the interval of the octave. See MUSIC.

**DYATRIBE** (ML. *diatriba*, discussion, Gk. *διὰ τριβή*, *diatribē*, disputation, from *διὰ τριβήν*, *diatribēin*, to discuss, from *diá*, *dia*, through + *tribēn*, *tribein*, to rub). A disputation or critical exercise. The name was originally applied to a critical examination of a literary work, but was later extended to bitter and violent criticism, written or spoken, on any subject.

**DIAULOS**. See OLYMPIC GAMES.

**DÍAZ**, DON JUAN MARTÍN. See EMPÉCINADO.

**DÍAZ**, DÉ'ás, PORFIRIO (1830-1915). A president of Mexico. He was born at Oaxaca, of Spanish parentage, and was studying law in his native town when the war with the United States broke out. Young Díaz entered a militia regiment in 1847 and thenceforth devoted himself to a military career. In 1854 he commanded a battalion under Alvarez in the contest against Santa Anna. A few years later he identified himself with Juárez and the Liberal party and in 1861 was elected deputy to the National Congress. He soon resigned to take the field and won a victory over the reactionist Marquez at Jalatlaco. During the French intervention he won a high reputation as one of the most skillful and courageous of the patriot leaders. In May, 1863, while directing the defense of Puebla, he was forced to surrender, but escaped shortly after and went to Oaxaca, where he raised a new force and made considerable headway against the French. In February, 1865, he was again captured, but escaped once more, and once more reappeared at the head of an army he had brought together at Oaxaca. He gradually forced the invading troops to adopt the defensive, and after the evacuation of Mexico by the French he advanced to Puebla and took the city, April 2, 1867. On June 21 he entered the city of Mexico. In the same year he was a candidate for the presidency against Juárez, but, being defeated, withdrew to his estates. He never ceased plotting against the government, however, and his intrigues occasionally broke out in the form of armed revolts against Juárez and his successor, Lerdo de Tejada. He was twice forced to flee the country—in 1872 and again in 1876. Returning quickly on both occasions, Díaz succeeded in the latter year in defeating his enemies at Tecuac (November 16). He finally drove Lerdo out, and in May, 1877, he became President. Order was restored in a remarkably short time. Díaz soon managed to win the confidence of European investors, the country was opened up, industries were developed, and the modern period of prosperity was firmly established. As the Mexican constitution provided that no man should hold the office of President for two consecutive terms, General Díaz was succeeded in 1880 by his close personal friend General Gonzalez. It soon became evident, however, that only one man could win the trust and support of the Mexican people and of the foreign capitalists upon whom the welfare of the nation depended, and so, after Díaz had been again elected President in 1884, the constitution was amended in order to provide for his continuance in that office. The forms of election by popular vote were duly complied with at each recurring period since, but no serious opposition to Don Porfirio, as he was affectionately called by the Mexican populace, devel-

oped. Opposition to what was considered his dictatorial role culminated in the early part of 1911 in a revolution headed by Francisco Madero. This was successful, and Díaz abdicated in May, 1911. He died in Paris, July 2, 1915.

**DÍAZ, de'áth, RUY, rōs** (1503-38). A Spanish soldier, born at Seville, Spain. In 1532 he accompanied the expedition of Diego de Almagro to Peru, participated in the capture of Cuzco (1534), and displayed remarkable skill and courage in his encounters with the Indians. He was subsequently selected by Pizarro to choose the site of a city to serve as the capital of the province and thus became the founder of Los Reyes (now Lima), the building of which was begun Jan. 18, 1535. He afterward took an active part in the campaign in Chile and supported the cause of Almagro.

**DÍAZ DE LA PEÑA, de'áz' de lá pá'nyá', NARCISSE VIRGILLE** (1807-76). A French landscape painter, of the Barbizon school. He was born in Bordeaux, of Spanish parents, refugees from Salamanca. His father died in England when the boy was three years old, and his mother, returning to France, supported him by teaching Spanish and French. She died at Sèvres, near Paris, when he was 10 years old, and Narcisse was adopted by a Protestant clergyman of Bellevue. He rambled through wood and dale, acquiring that love of nature which afterward made him a great landscape painter. In one of these rambles Narcisse was bitten by a poisonous insect, which necessitated the amputation of his leg. He was apprenticed to a porcelain maker at Sèvres, an uncle of Dupré, who worked there and became his staunch friend. This work, no doubt, helped to develop his wonderful sense of color, but Díaz was too independent a genius to become a porcelain painter. While studying painting, he lived in great poverty in Paris, even having to beg. François Souchen, an historical painter, was his teacher, but Díaz was much attracted by the works of Correggio in the Louvre and seems also to have been influenced by Leonardo and Prudhon. But he always went his own way, and was in the main self-taught. About 1836 he went to Barbizon, where, under the influence of Rousseau, he devoted himself to landscape painting, producing the best of his works. He continually exhibited at the Salon, receiving medals in 1844, 1846, and 1848 and the cross of the Legion of Honor in 1851. He was very prolific, and, as his pictures sold well, he became quite wealthy. He was fond of life, and in his magnificent studio in Paris he dispensed great hospitality. He died at Mentone, Nov. 18, 1876, in consequence of a cold taken at the opera.

Díaz was a man of unusual gifts, but he lacked the application and perseverance essential to a genius of the very first order. He was an admirable colorist, brilliant in execution, and of a striking originality, but his drawing was often weak. His landscapes are usually treescapes, showing the play of light and shade among forest trees. He peoples them with nymphs, cupids, Oriental women in gaudy costume, gypsies, and the like. He loved the summer with its bright sunshine and especially excelled in depicting rich autumn tints. Díaz is magnificently represented in the Louvre, particularly since the acquisition of the Thierry collection with eight examples and the Chaudard with 15. Among the best of these are:

"The Fairy with Pearls," "Venus and Adonis," "Foolish Girls," the brilliantly tinted "Descent of the Gypsies," and a magnificent landscape, "Sous bois." Fine collections of his paintings are also in the Museum of Rheims with 10 examples, and at Montpellier with five, in the Alexander Young collection, London, and in the Metropolitan Museum, New York (including the Vanderbilt collection), with 11 examples, including a splendid landscape, the "Forest of Fontainebleau." He is represented also in other American public and private collections, such as the Art Institute of Chicago, the Walters collection, Baltimore; in many French provincial museums; in the National Gallery, Berlin, the Mesdag Gallery, The Hague, and many other European galleries. Consult: Muther, *History of Modern Painting* (London, 1907); Balluins, in *Les artistes contemporains* (Paris, 1877); Hoelber, in Van Dyke, *Modern French Masters* (New York, 1896); Hustin, in *Les artistes célèbres*, and the authorities cited under BARBIZON, PAINTERS OF.

**DÍAZ DEL CASTILLO, de'áth del ká-stē'lyó, BERNAL** (c.1492-'1593). A Spanish soldier and author, born at Medina del Campo. In 1514 he sailed for America to better his fortunes, and he landed, after a short residence at Noubre de Dios, in Cuba, whence he made several expeditions to the west. He accompanied Cortés to Mexico in 1519 and after the conquest settled in that country. His *True History of the Conquest of New Spain* is important because narrated by an eyewitness. The style of it, however, is far from elegant. The first edition appeared at Madrid in 1632 in three volumes, under the auspices of Friar Alonso Remón, who very badly garbled the text. Within the next few years four other editions appeared. English versions of these corrupt editions appeared in 1800 (by Maurice Keatinge) and in 1844 (by John Ingram Lockhart). The work was done into German in 1838 by Ph. J. von Rehfues and in 1848 by Karl Ritter. Two French versions were made simultaneously and independently by D. Jourdanet (who published his in 1876) and José María de Heredia (in 1877). Hungarian also had two translations, by Károly Brózik (1878) and by Moses Gaal (1899). Some of these translations went to second editions—Keatinge (1803), Rehfues (1843), and Jourdanet (1877). None of these editions or translations did justice to the original, and certain strictures have consequently been made concerning Castillo's *History* that can no longer be maintained. The original manuscript has always been kept in Guatemala, first by the author, then by his descendants, and later by the municipality of the capital, in whose archives it rests to-day. This manuscript consists of one large folio volume, containing 297 leaves, written on both sides, and bound in old leather. It was published and edited critically for the first time by Genaro García in Mexico, 1904. An English translation of this edition was made by Alfred Percival Maudslay and published, with introduction and notes, for the Hakluyt Society (3 vols., London, 1908). These two new publications throw a world of new light upon the importance and credibility of Castillo's account and prove it to be second only to the account of Cortés in his letters to the Emperor.

**DÍAZ DE PINEDA, dá pé-ná'ná, GONZALO** ('-1545). A Spanish soldier in Peru, born in Torrelavega. In 1531 he accompanied Francisco

Pizarro on the latter's final expedition to Peru, in 1535 explored the Magdalena River to its mouth, in 1536 discovered the country of the Canelos Indians, and in 1540 went with Gonzalo Pizarro on the ill-fated expedition for the conquest of that region. Sent with a small band in an unsuccessful search for Orellana, who had been dispatched down the Napo River for supplies, he returned to assist them at last in reaching Peru with a half-starved remnant of the expedition. When, in 1544, Gonzalo Pizarro rebelled against the Viceroy, Nuñez de Vela, he at first sided with the latter, but subsequently joined Pizarro. Defeated by the Viceroy at Colliquén, he escaped, but died from the mistaken use of poisonous plants for food.

**DÍAZ DE SOLIS**, só-lés'. See SOLIS.

**DIAZÆUTIC TONE** (Gk. *διαζευκτικός*, *diazeuktikos*, disjunctive, from *διαζευγνύειν*, *diazeugnynai*, to disjoin, from *διά*, *dia*, apart + *ζευγνύειν*, *zeugnynai*, to join). In Greek music, that tone which separates the tetrachords (q.v.) of the three oldest modes. In the Dorian mode the diazeutic tone was the step from b to a. In the later modes the tetrachords were constructed so that the lowest tone of the higher tetrachord was at the same time the highest tone of the lower tetrachord. Then the diazeutic tone was either above the highest or below the lowest tetrachord. (See GREEK MUSIC.) In the following modes the diazeutic tone is marked +:

Dorian  $c'-d'-e'-f'-g'-a'-b'-c'-b'-a'-g'-f'-e'$ .  
 Æolian  $a-g-f-e-d-c-B-A$ .  
 Mixolydian  $b-a-g-f-e-d-c-B$ .

**DIAZO COMPOUNDS** (from Gk. *δῖς*, *dis*, twice + *azo-te*, old name of nitrogen, from Gk. *α, η, priv.* + *ζῶειν*, *zōein*, to live). An important group of carbon compounds discovered by Peter Griess in 1860. They are produced by the action of nitrous acid on salts of aromatic amido compounds, such as aniline hydrochloride. Thus, diazo-benzene chloride is produced according to the following equation:

The diazo compounds are usually obtained in solution and are immediately transformed into other compounds: the given aromatic amido compound (say, aniline) is introduced into aqueous hydrochloric acid, and the solution is "diazotized" by the addition of an aqueous solution of sodium nitrite, drop by drop, with stirring, until the nitrous acid produced by a drop fails to be absorbed. The solution now contains the required diazo compound, and further transformation is effected by treating the solution as a whole. But diazo compounds have also been isolated as such. When pure and dry, they are colorless crystalline solids, chemically unstable and even more or less explosive.

The following are the principal transformations of these peculiar substances:

1. When an aqueous solution of a diazo compound is warmed, the compound is transformed into the corresponding phenol. (See PHENOLS.) Thus, diazo-benzene nitrate (obtained by the action of nitrous acid on aniline nitrate) gives

ordinary phenol (carbolic acid), according to the following equation:

Similarly,

The best salt to use for this transformation is diazo-benzene sulphate, which yields practically no by-products. The transformation is, further, greatly aided by the action of light.

2. Diazo-benzene iodide would react differently: instead of combining with water, it would, if warmed in aqueous solution, simply lose its nitrogen and change into iodo-benzene:

Iodo-benzene is thus usually prepared by diazotizing aniline in hydrochloric acid solution, adding potassium iodide (which changes the diazo-benzene chloride in solution into diazo-benzene iodide), letting the mixture stand for several hours, and distilling, the iodo-benzene being readily isolated from the mixed distillate. Iodine derivatives of other hydrocarbons than benzene are similarly obtained with the aid of potassium iodide.

3. From the above it is clear that an  $\text{NH}_2$  group in an aromatic compound can be readily exchanged, through diazotization, for either an OH group or an iodine atom. A chlorine or bromine atom cannot thus be introduced: in 1884, however, Sandmeyer discovered that if, before a solution of a diazo chloride or bromide is warmed, cuprous chloride or bromide is added to it, the result is, not combination with water and the entrance of an OH group, but the entrance of a chlorine or bromine atom. This modification of the method is known as the *Sandmeyer reaction*. Later Gattermann found that finely divided metallic copper, added to a solution of a diazo chloride or bromide, produces the same effect as the cuprous salt.

The Sandmeyer reaction is explained by the assumption that the diazonium salt, i.e., the diazo chloride or bromide, forms a double compound with the cuprous salt, and that it is the double compound that breaks up, yielding the desired halogen substitution product:

4. The Sandmeyer reaction permits of exchanging an  $\text{NH}_2$  group also for a nitril group (CN). For example:

And as the nitril group can be readily transformed into the acid group (carboxyl,  $\text{COOH}$ ), it is obvious that by diazotization and the Sandmeyer reaction an  $\text{NH}_2$  group can be exchanged for a carboxyl group; i.e., an amido compound can be changed into an acid.

5. If the solution of a diazonium salt is rendered alkaline with sodium hydroxide, mixed with an alkaline solution of sodium stannite, and the mixture gently warmed, the result is that the unstable diazo-hydroxide formed at first loses its nitrogen together with the oxygen of its OH group, and a hydrogen atom alone remains in the place of the original  $\text{NH}_2$  group. For example:

### Aniline

**Diazo-benzene  
chloride**

**Dianis-benze  
hydroxide**

Benzene  
(a hydrocarbon)

A similar transformation takes place when a diazonium salt is heated with alcohol, but then a second reaction takes place simultaneously and in many cases even predominantly.

6. If the solution of a diazonium salt is strongly acidified with hydrochloric acid, mixed with stannous chloride, and the mixture warmed, the result is a derivative of hydrazine (q.v.)—the well-known phenylhydrazine, e.g., being thus readily obtained from diazo-benzene compounds:

Diao-benzene chloride      Phenylhydrazine

### Phenylhydrazine

The reactions noted above suffice to indicate that a great many aromatic compounds of several important classes may be produced, through diazotization, from the corresponding amido compounds. And as amido compounds are readily made by starting with the hydrocarbons abundantly contained in coal tar, it is easy to see why the diazo reaction is so extensively used, and diazo compounds regarded as so important, both in the industries (particularly in the manufacture of dyestuffs) and in the scientific laboratory. See also AZOBENZENE; COAL-TAR COLORS.

Derivative of the aliphatic series cannot as a rule be diazotized; in these, an  $\text{NH}_2$  group is directly transformed, by the action of nitrous acid, into the group  $\text{OH}$ . For instance, ethylamine,  $\text{C}_2\text{H}_5\text{NH}_2$ , would give ordinary alcohol,  $\text{C}_2\text{H}_5\text{OH}$ ; but no intermediate diazo compound would be formed. The esters, however, of certain aliphatic amino acids do give diazo compounds, and these are of no little value. The best known among these substances is the ethyl ester of *diazoo-acetic acid*, whose formula is

This remarkable substance, first obtained by Curtius in 1883, melts at 24° C., and under a pressure of 72 millimeters of mercury boils without decomposition at 143° C.

In conclusion, it may be mentioned that Kekulé's constitutional formulae of the diazonium salts, used above for the sake of convenience, have now been superseded by formulae first recommended by Blomstrand as far back as

1869. Thus, diazo-benzene chloride is now preferably written:

**DIBBS.** An English name for a game of great antiquity, played by boys and girls. In Russia it is sometimes played even by old men. It consists in throwing up the small joint bones of the legs of sheep and catching them first on the palm and then on the back of the hand. The antiquity of this simple kind of play is proved by figures on Grecian vases on which women are seen kneeling and engaged in the sport. In Scotland, where the game is more usually played with small pebbles or shells, it is called the "chucks" or "chuckie stanes." Out of dibbs developed the game of jackstones.

**DIBDIN, CHARLES (1745-1814).** An English dramatist and song writer. He was born at Southampton and began his literary career with an opera called *The Shepherd's Artifice*, produced at Covent Garden Theatre in 1762. Already a popular actor, he gained great celebrity, in 1789, by a series of musical entertainments entitled *The Whim of the Moment*. He died in straitened circumstances. Dibdin wrote about 70 dramatic pieces and, according to his own account, 900 songs, of which the best known are "Poor Jack" and "Tom Bowling." He composed the music of his songs and sang them himself. Of his sea songs, he said, they "have been the solace of sailors in long voyages, in storms, in battle; and they have been quoted in mutinies to the restoration of order and discipline." His sons, Charles and Thomas John, wrote songs and dramas. Consult: his *Professional Life* (1803), an autobiography; a brief *Life* in G. Hogarth's edition of his songs (1848); Dibdin, *The Dibdins* (London, 1888).

**DIBDIN, THOMAS FROGNALL** (1776-1847). A British bibliographer. He was born at Calcutta, India, studied at Oxford, and, after a short career as a lawyer, entered the Established church in 1804. He began his work in 1797 and until 1844 produced a great number of publications of a bibliographical and antiquarian character, which while they show an immense amount of labor, are so full of inaccuracies as to be almost totally unreliable. His *Bibliomania* (1809) was effective in stimulating interest in rare and early editions and led to the hearty reception of his proposal for an association of bibliophiles, which was organized as the Roxburghe Club (q.v.) in 1812. Dibdin being its first vice president. In addition to the *Bibliomania*, Dibdin's principal works are: *An Introduction to the Greek and Latin Classics* (1802); *Typographical Antiquities of Great Britain* (4 vols., 1810-19); *The Bibliographical Decameron* (1817); *Bibliotheca Spenceriana* (1814); *Bibliographical, Antiquarian, and Picturesque Tour in France and Germany* (1821); *The Library Companion* (1824); *Reminiscences of a Literary Life* (1836).

**DIBON.** The name of two cities mentioned in the Bible. 1. A city in Moab, the modern Dhiban, about 4 miles north of Arnon (*Wady Mojib*) on the road between Heshbon and Petra. According to Num. xxxii. 34, it was built by the Gadites, and, in harmony with this account, the place is referred to as Dibon-Gad in Num. xxxiii. 45. In Num. xxi. 30 the Amorite King, Sihon,

is said to have reigned over Moab "from Heeshbon to Dibon." It has been held by Meyer, Stade, and many scholars that the ancient song whence this fragment is taken celebrated victories of Israel over Moab in the ninth century B.C. But Schmidt, in *Messages of the Poets* (1911) and "Songs of the Conquest," in *Journal of Biblical Literature* (1914), and Böhl, in *Kanaanäer und Hebräer* (1911), have shown that there is no reason to doubt the existence of Sihon's kingdom in the light of what is now known concerning the Amorites (q.v.), and no situation in the ninth century that can be reflected in the song. That is also emphasized by the Mesha inscription found by Klein at Dibon in 1868. (See MOABITE STONE.) Mesha is here called the Dibonite, or Daibonite, as the presence of the *yod* and the Greek *δαίβωρ* suggest that the true pronunciation was. It is not quite clear whether the name is limited to the city or extended to the adjacent territory, and it has therefore been supposed that the proper name of the city in earlier times was Qorcha, and Daibon the name of the district. But it is more probable that Qorcha was the name of a certain quarter of the city where the royal residence was, and that the relation between Qorcha and Daibon was analogous to that between Zion and Jerusalem. 2. A place in Judah, mentioned in Neh. xi. 25, the present Dhaib, 5 miles north of Arad.

**DIBRA**, δῆβρα. A city in the Kingdom of Servia, 3 miles from the juncture of the Black Drin and Radika rivers, near the Albanian frontier (Map: Turkey in Europe, C 4). The population, numbering about 16,000, are mainly Albanians, but there are influential Serb and Bulgarian colonies, the latter of whom support the only bishop of the Bulgarian exarchate among the Albanians. Dibra is a fortified city, and the centre of an important agricultural trade. It was long the capital of the sanjak of Dibra in the Turkish Vilayet of Monastir, but was taken by the Servians in the Balkan War (q.v.) and confirmed to them by the treaty adjustments of 1913.

**DIBRANCHIATA** (Neo-Lat. nom. pl., from Gk. *dis*, *dis*, twice + *bránychia*, *branchia*, gills). A group of cephalopod mollusks, characterized by the presence of a pair of gills and by the internal position of the shell, as contrasted with the two pairs of gills and external shell of the tetrabranchiate nautiloids; the dibranchiate skeleton supporting the internal organs; the tetrabranchiate shell serving as an external protective covering to the animal. The Dibranchiata have undoubtedly been evolved from the Tetrabranchiata, probably in Triassic time, and there are even yet a few living forms, as *Spirula*, which are relics of the early intermediate stages between the two groups. Modern examples are the cuttlefish, squid, octopus, and sepia (qq.v.); while *Belemnites* (q.v.), *Belemnitoides*, *Geolites* (q.v.) are a few of the many fossil forms which range from Triassic to recent times. For illustration, see Colored Plate of **DECAPODS**, ETC.

**DICÆARCHUS** (Lat., from Gk. *Δικαίρχος*, *Dikaiarchos*). A Greek philosopher of Messina, in Sicily, a contemporary of Aristotle, and friend of Theophrastus (q.v.). The ancients, including Cicero, warmly praise his works. Of these it is quite impossible to determine an accurate bibliography, since many referred to as independent works were probably sections of larger volumes. His *Bios* 'Ελλάδος ('The Life of

Greece,' in 3 books), in addition to political affairs, took some account of poetry, music, and the games, and was thus the pioneer attempt in what the Germans style *Kulturgeschichte*. The fragments of this work were edited by Fuhr (1841). His *Τριπολίτικος*, *Tripoliticoe*, was an account of the ideal form of government: this Dicæarchus found in a mixture of monarchy, aristocracy, and democracy, such as existed at Sparta. In his *Λασιβακὸς Λόγος*, *Lasbiakoi Logoi*, and his *Κορινθιακὸς Λόγος*, *Korinthiakos Logoi*, cast in dialogue (q.v.) form, he sought to prove the soul mortal. (Consult Cicero, *Tusculanæ Disputationes*, i, 21 and 77, and editors there.) He wrote also a description of the world, illustrated by maps; in this field he was the most important forerunner of Eratosthenes (q.v.). Consult the article "Dikaiarchos, 3," in Pauly-Wissowa, *Real-Encyclopædie der klassischen Altertumswissenschaft*, vol. v (Stuttgart, 1905), and Christ, *Geschichte der griechischen Literatur*, vol. ii (5th ed., Munich, 1913).

**DICÆUM** (Neo-Lat., coined by Cuvier, 1817). A genus of Oriental and Australasian small birds, typical of a family, Dicaeidae, closely allied to the sunbirds. They are sometimes called honey peckers or flower peckers (in India), but without much reason, and the scientific name has become English in Australia, where the family is most prominent. All are small, brilliant-colored, insect-eating birds, with melodious voices, and most of them build elegant purse-shaped nests of soft materials suspended from bushes. The swallow dicæum (*Dicaeum hirundinaceum*) is one of the best known, and resembles in size, shape, and habits one of the northern kinglets, but is purple blue, with a red throat and under tail coverts. Some ornithologists put here also the diamond bird (q.v.), but most class it elsewhere. See Plate of **PENSILE NESTS OF BIRDS**, with **NIDIFICATION**.

**DYCAST** (Gk. *δικαστής*, *dikastēs*, from *δικν*, *dikē*, right, justice). A member of the popular courts of Athens. These courts seem to have been instituted by Solon, and from the fifth century B.C. were a most important part of the democratic government. From the body of Athenian citizens over 30 years of age there were chosen annually by lot 6000 in the fifth century, 5000 or possibly fewer in the fourth century. From this number sections, of not over 501, were chosen daily to hear cases. In very important trials two or more sections might be combined, and we hear of one court of 2500 jurors; sometimes, on the other hand, but 20 or 40 formed the court. The evidence was taken beforehand by a magistrate, who presided at the trial, and the dicasts merely listened to the speeches of the parties to the suit and the reading of the evidence. The voting was secret, and the dicasts were sworn to render their decision in accordance with the laws and the evidence. Unlike a modern jury, they were the sole judges of the law as well as of the facts, a condition which hindered the development in Athens of any such body of judicial precedents as grew up in Rome. Consult Meier and Schömann, *Der attische Process* (Berlin, 1833-87), and Lipsius, *Das attische Recht und Rechtsfahren* (Leipzig, 1905- ). See **HELLEA**.

**DICE** (OF. *de*, *det*, Fr. *dé*, Sp., Portug., It. *dado*, die, from Lat. *datus*, p.p. of *dare*, to give). The origin of dice is variously ascribed by some authors to occult sources, but more authentically to Psalmedes of Greece (1244 B.C.).

Without question the games played with them are the simplest and most universal games of chance in the world. The dice exhumed from Thebes differ in no respect from the six-sided cubes of bone or ivory in use to-day, with spots ranging on each side from 6 to 1, the sum of the spots on the opposite sides of a cube always making 7. Dice are thrown nearly universally from a cylindrical hollow case, but among the negroes, in the game of craps (q.v.), they are cast from the hand. Mostly they are thrown from the box upon a table, but it was not uncommon in some parts of England until quite recent times to throw them into a bowl. According to the purposes of the cast, any number, from one to five dice, are cast. The highest aggregate numbers exposed on the top of the dice when they settle, in one or more throws, as agreed, win. There are a variety of other purely dice games, such as "round the spot," wherein only those spots which lie round a centre spot are counted, such as three or five—the first counting two and the other four: "multiplication," in which the first throw is three dice, the highest being left on the table and the two thrown again, the highest being again left and the last one thrown again; and "draw poker," played with five dice, each player having one throw and the privilege of a second. In the first throw all the dice are thrown, but the player need not take them all up; he may select only those which are satisfactory to him or leave the whole. The throws rank as in the card game of poker (q.v.), beginning with the lowest: one pair, two pairs, triplets, a full hand, four of the same; the highest throw is five alike. *Fengt-un* is played with a single die, each player throwing as often as necessary to get the sum of the spots equal to, or as near as possible, not over, 21. "Ace in the pot" and "help your neighbor" are other combinations of throwing the dice, or, in other words, "casting the die." Unscrupulous gamblers adopt the practice of loading dice by plugging them with lead on a particular side, so that the highest number may turn up, by gravitation, as the dice roll out of the box. Consult *Foster's Complete Hoyle* (New York, 1909).

**DICENTRA** (Neo-Lat. nom. pl., from Gk. *dikēntros*, *dikēntros*, two-pointed, from *di-*, double + *kēntron*, *kēntron*, point). A genus of hardy perennial plants of the family *Fumariaceae*. *Dicentra spectabilis*, bleeding heart, a native of Siberia and the northern provinces of China, was introduced into Great Britain from the island of Chusan in 1846 and rapidly became a general favorite on account of its long racemes of drooping, delicate, rosy-pink flowers. The common squirrel corn (*Dicentra canadensis*) is one of the first spring flowers of the northern and eastern United States, as is also Dutchman's-breeches (*Dicentra cucullaria*). *Diletrya* is an old name for the genus *Dicentra*.

**DICEY**, di'si, ALBERT VENN (1835– ). An English barrister and author. He was educated at Balliol College, Oxford, was admitted to the bar in 1863, from 1882 until 1909 was professor of English law in the University, and later became a fellow of All Souls' and an honorary fellow of Trinity College. He received in 1890 an appointment as Queen's Counselor and in 1899–1912 was principal of the Workingmen's College. His publications include: *The Privy Council* (Arnold prize essay, 1860 and 1887); *The Law of Donicil* (1879); *England's*

*Case against Home Rule* (1886); *a Treatise on the Conflict of Laws* (1896); *Lectures on the Relation between Law and Public Opinion in England during the Nineteenth Century* (1905); *Introduction to the Study of the Law of the Constitution* (7th ed., 1908).

**DICEY**, EDWARD (1832–1911). An English journalist and author. He was educated at Trinity College, Cambridge, was for a time a leader writer for the *Daily Telegraph*, and from 1870 to 1889 was editor of the *Observer*. In 1875 he was called to the bar. He was regarded as an authority on matters appertaining to South Africa, Bulgaria, and Egypt. He was created C.B. in 1886. His publications include: *Rome in 1860* (1861); *The Schleswig-Holstein War* (1864); *The Morning Land* (1870); *England and Egypt* (1884); *Bulgaria, the Poasant State* (1895); *Story of the Khedivate* (1902); *The Egypt of the Future* (1907).

**DICHO GAMY**, di-kōg'a-mi (Gk. *δίχα*, *dicha*, in two + *γάμος*, *gamos*, marriage). Flowers whose anthers and stigmas do not mature at the same time are said to be dichogamous. "Protandry" is the condition in which the anthers mature first; "protogyny" that in which the stigmas mature first. See **POLLINATION**.

**DICHOTOMY**, di-kōt'o-mi (Gk. *διχοτομία*, *dichotomia*, a cutting in two, from *δίχα*, *dicha*, in two + *τέμνω*, *temnō*, to cut). In botany, a form of branching in which the axis forks at the apex and hence continues no farther. It is specially characteristic of cryptogams. (See **BRACHYCLADIA**.) In logic, the method of exhaustive division in classification, of which the device known as the Tree of Porphyry may be considered typical (consult, e.g., *Lessons in Logic*, W. Stanley Jevons, London, 1880). In metaphysical anthropology, the theory of man as a twofold being, physical and spiritual, or consisting of body and soul.

**DYCHROISM** (from Gk. *di-*, double + *χρῶμα*, *chrōma*, color), **TRICHROISM**, **PLEOCHROISM**. Crystals not only absorb in different amounts the light of different wave lengths, but, unlike uncrystalline or amorphous substances, the amount and kind of absorption differ according to the direction in which light is transmitted through the crystal. This selective and differential light absorption is rarely perceived by the unaided eye, because so many rays from a crystal enter the eye simultaneously. If, however, polarized light be employed to bring successively into the eye light rays which at any given instant vibrate along a single direction of a colored crystal, a change in color is generally noticeable. This selective light absorption along the different directions within a crystal is termed dichroism or pleochroism. Crystals of the isometric system alone possess no pleochroism. Crystals of the tetragonal and hexagonal systems exhibit two extreme colors (dichroism), between which all the other colors produced clearly graduate. Crystals of the remaining crystal systems exhibit three extreme colors (trichroism), with regard to which all the other colors produced by the crystal are intermediate. The dichroscope is a simple device for measuring both the quality and quantity of dichroism. See **CRYSTALLOGRAPHY**.

**DYCHROITE**. See **IOLITE**.

**DICHROMATISM IN BIRDS** (Gk. *di-*, double + *χρῶμα*, *chrōma*, color). The name given to that peculiar occurrence of two phases of color in the plumage of a species of bird,

not due to age, sex, or locality, which is so well illustrated by the common eastern screech owl of the United States (*Otus asio asio*), some individuals of which are gray and some rusty red. This phenomenon is not infrequent among birds, but it is not always easy to determine what constitutes a clear case of it. Thus, some ornithologists regard the various species of flicker (*Colaptes*) as di- or rather tri-chromatic forms of a single species, while others do not regard this as the same sort of a phenomenon as the color phases of the screech owl. There are at least three distinct forms of dichromatism, known as *albinism*, *melanism*, and *erythrism*. The first is that form in which one of the phases is white, and a number of examples occur among the herons as well as in other groups of birds. One of the best-known cases is that of the little blue heron (*Florida acerulea*), some specimens of which are pure white, while others are slaty blue. It was at one time supposed that the former were the young, the latter the adults; but careful study on their breeding grounds has shown that the differences are not associated in any way with age or sex. Some evidence has been produced to show that geographical conditions may have something to do with the matter, for the white birds are said to be most common on the Atlantic coast of Florida, while the colored phase is most abundant on the Gulf coast. Melanism is a form of dichromatism in which one color phase becomes very dark, almost or quite black. Examples of this occur among the large hawks of the genus *Buteo*. It should be stated that in these cases the color phases are not sharply set off from each other, as in the herons, and the melanism is rather closely associated with distribution. Erythrism is the form shown by the screech owls, already referred to, in which one phase tends to become red.

A satisfactory explanation of dichromatism is still to be offered, but recent investigations have thrown some light upon it. In the screech owl the red phase is due to a "quantitative difference" in the distribution and relative amounts of pigment, and it is said that gray individuals may become red. For these experiments consult Chadbourne, *The Auk*, vols. xiii, xiv (New York, 1896, 1897). These results should be confirmed before they are accepted as absolute. In other cases, such as the herons, it is more than possible that we have examples of species in the process of formation, and that at some future day the slaty-blue individuals of the little blue heron, e.g., will breed only with slaty-blue individuals and produce only slaty-blue offspring, while the white birds will breed only with white birds and produce white young. We should then have just such a condition as now exists in the ibises of the genus *Guara*. The white ibis (*Guara alba*) and the scarlet ibis (*Guara rubra*) are exactly alike, except for the striking difference in color, but they never breed together and are therefore regarded as two distinct species and not as dichromatic forms of one. The whole question is one of exceptional interest and seems to be closely bound up with that of the origin of species.

**DICHTUNG UND WAHRHEIT**, dīk'tung unt vā'r'hīt. See GOETHE.

**DICK, CHARLES** (1858- ). An American legislator, born at Akron, Ohio, where, after admission to the bar in 1893, he took up the practice of law. During the Spanish-American War he served with the Eighth Ohio Volunteers.

He was auditor of Summit Co., Ohio (1886-93), chairman of the Republican County Committee (1887-91) and of the Republican State Executive Committee (1892-94 and 1899-1907), secretary of the Republican National Committee (1897-1900), and delegate to the Republican National Convention (1892, 1896, 1900, and 1904). While a Representative in Congress (1898-1904), he introduced the Dick Militia Bill, which became law. He was United States Senator from 1904 to 1911.

**DICK, JOHN** (1764-1833). A Scottish Secession theologian. He became pastor in Glasgow in 1801 and theological professor in 1820 and is remembered for his *Lectures on Theology* (4 vols., with memoir, 1834; Am. ed., 2 vols., 1836).

**DICK, MR.** A household abbreviation for Mr. Richard Dabley, a demented character in Dickens's *David Copperfield*.

**DICK, SIR ROBERT HENRY** (c.1785-1846). A Scottish soldier, son of a doctor in the East India Company's service. He entered the army in 1800 and served as an officer in the Peninsular War, fighting at Busaco, Fuentes de Onoro, and Salamanca. He distinguished himself at Quatre Bras and Waterloo; in 1837 was promoted to be major general, and in 1841-42 was acting commander in chief at Madras. In 1846 he assumed command of the Third Infantry Division in the Sikh War. He fell while leading a second charge against Sikh intrenchments at Sobraon.

**DICK, THOMAS** (1774-1857). A Scottish scientific writer. He was born near Dundee and studied science and theology at the University of Edinburgh. After a brief pastoral charge in connection with the Secession church of Scotland, he devoted himself to teaching, lecturing, occasional preaching, and authorship. Towards the close of his life a small pension was granted him in consideration of his literary services, his books having brought him very little pecuniary return, in spite of their great popularity both in England and the United States. He died at Broughty Ferry, near Dundee. Dick's principal works are: *The Christian Philosopher, or the Connection of Science and Philosophy with Religion* (1823, 8th ed., 1842); *The Philosophy of Religion* (1825); *The Philosophy of a Future State* (1828); *Celestial Scenery* (1837); *The Sidercal Heavens* (1840); *The Practical Astronomer* (1845). Several of Dick's writings have been translated into foreign languages, one even into Chinese. Consult Chambers, *Eminent Scotsmen* (Edinburgh, 1868).

**DICK REQUEST.** A fund now amounting to some £122,000, established in 1828 by James Dick, of Finsbury Square, London, for the benefit of the parish schoolmasters of Moray, Banff, and Aberdeen, Scotland. These funds yield about £4000 a year, which is distributed as an honorarium among the schoolmasters on the basis of their acquirements in the English language and literature, geography, mathematics, Latin, Greek, history, physics, and the art of teaching. Mr. Dick's object was to encourage active schoolmasters and gradually to elevate the literary character of the parochial schoolmasters and schools. His purpose has been so far successful that the grade of these schools has been advanced, and in many cases students go directly from them to the universities. Consult J. Kerr, *Scottish Education, School and University from Early Times to 1908* (Cambridge, 1910).

**DICKCISSEL** (imitative). The black-throated bunting (*Spiza americana*) of the open regions of the central United States, one of the most pleasing of American fringilline birds. Its back is black, chestnut, and grayish; bend of the wing, bright chestnut; chin, white; throat, black, in a conspicuous crescent; breast, yellow, changing to white towards the tail. The female lacks the black breastmark and the chestnut colors. The species is migratory, coming northward to make its nest on the ground, or in a low bush, where pale-blue eggs are laid. It is a loud and persistent singer. "All day long," says Ridgway, "in spring and summer, the males, sometimes to the number of a dozen or more for each meadow of considerable extent, perch upon summits of tall weed stalks or fence stakes, at short intervals, crying out: 'See, see, dick, dickcissel, cissel!': therefore 'Dick Cissel' is well known to every farmer's boy." See illustrations on Plate of BUNTINGS, ETC., and of EGGS, I.

**DICKENS, CHARLES** (1812-70). An English novelist. He was born at Landport, a suburb of Portsea, Feb. 7, 1812, and was baptized Charles John Huffham. His father, John Dickens, who held a post in the navy pay office, was then stationed at Portsmouth, but about 1816 they moved to Chatham and afterward to London. The family was poor and improvident. His father, whom he afterward portrayed in Mr. Micawber, was imprisoned for debt in the Marshalsea, and the family for a time resided in the prison with him. Dickens worked for a while in a blacking warehouse, but after his father was relieved from his embarrassments by a fortunate legacy, Charles attended private schools. His opportunities on the whole, however, were slight, but he read considerably at home and in the British Museum and learned shorthand. He was educated by contact with life itself. After a period of reporting in the courts and in the House of Commons Dickens began in the *Monthly Magazine* (December, 1833), and continued in the *Evening Chronicle*, a series of essays and tales, collected and published in 1836, under the title *Sketches by Boz*. Encouraged by their success, he undertook to write the letterpress of the *Posthumous Papers of the Pickwick Club*, the illustrations of which were to be executed by Robert Seymour, a comic draftsman. As soon as Dickens introduced Sam Weller, the plates became of secondary interest. The *Pickwick Papers*, which appeared in monthly numbers (1836-37), not only had enormous commercial success, but they also mark an era in English literature. It was the first of a series of fictions exhibiting the life and manners of the middle and lower classes, which up to that time had rarely found an exponent, and in one respect this book probably had neither predecessor nor progeny. Neither before nor since, if we except *Humphrey Clinker*, has there ever been such a literary embodiment of healthy animal spirits. There is none like it for unflagging but never unwise merriment—for humor that is very much the reverse of dry. *Pickwick* was followed by *Oliver Twist* (1837-39) and *Nicholas Nickleby* (1838-39), adventures in the picaresque manner. They are among the first of those social novels which form so marked a feature of modern literature. The former was an exposure of workhouses and of the city conditions that lead the children of the poor into crime; the latter was aimed at

the wrongs and cruelties inflicted upon their wretched pupils by the cheap schoolmasters of Yorkshire. Both 'hit their mark.' After this beginning Dickens set lance in rest against many a social monster. He may be sometimes wrong, but in spite of his exaggerations he can scarcely be accused of want of honesty of purpose; while quite as little can partisanship (except that he is always for the poor) be laid to his charge, since at the very time when the country gentlemen were shaking their heads at him for his want of reverence for "land," he incensed the manufacturing interest by the publication of *Hara Turis* (1854). His sarcasm is of a rather peculiar character; too good-natured to sneer, and with eyes, notwithstanding their indignant fire, that never lose sight of the ludicrous side of things; his style is mocking argument. After *Nicholas Nickleby* came *The Old Curiosity Shop* (1840) and *Barnaby Rudge* (1841). In the former, in the character of Little Nell, he first exhibited a power of setting forth child life and child thought unequalled before the appearance of George Eliot. *Barnaby Rudge* was his first and, with the exception of the *Tale of Two Cities* (1859), his only attempt to describe the past; and it was not entirely successful. A disposition of mind towards the weird and the grotesque, which showed itself in *The Old Curiosity Shop*, was subsequently developed with greater success in his *Christmas Stories* (1853), especially in *A Christmas Carol*. After a voyage across the Atlantic Dickens published, in 1842, *American Notes for General Circulation*; but a much more admirable result of that visit to the United States appeared in *Martin Chuzzlewit* (1844), which was perhaps the greatest of his humorous works since *Pickwick*; at least, the English scene is made delightful by the immortal Pecksniff and Mrs. Gamp, but the rascality in the American part of the book had no such good humor, and the violence of his satire does not become more attractive with time. After this work his animal spirits—a rare gift among even comic authors, and seldom lasting so long as in his own case—began to desert him. Humor, except in some rich creations, such as Mr. Micawber, was no longer so apparent; while, on the other hand, satire and pathos increased. In February, 1844, he went to Italy for rest, but returned at the end of the year to read to his friends *The Chimes*. His two other famous Christmas stories, the *Christmas Carol* and *The Cricket on the Hearth*, he wrote in 1843 and in 1845. After another year in Italy he tried for a month to edit the *Daily News*, from January to February, 1846, but he had no equipment for editing a newspaper. In June he was in Switzerland, at work on *Dombey and Son* (1848), which, in spite of its popular success, was considered a falling off in one who stood so high. Yet, when men were expecting that he would wane and weaken like other prolific writers before him, he produced *David Copperfield* (1850), a favorite with many, and preferred by Dickens himself to all his other novels. In this novel he adopted the form of an autobiography, and that perhaps offered him some advantages; at all events, the result was admirable. *Bleak House* (1853); *Hard Times* (1854); *Little Dorrit* (1857); *A Tale of Two Cities* (1859); *Great Expectations* (1861), regarded by Swinburne as the best and most artistic of Dickens's books; and *Our Mutual*

*Friend* (1865), by many readers thought to be his masterpiece, afterward succeeded one another with almost periodical punctuality, and each was awaited by an immense audience. In 1850 he commenced a weekly periodical entitled *Household Words*, and in 1859 a similar publication called *All the Year Round*. In 1858 he began his long series of public readings, which brought him applause and money, but which in the end broke down his health. In 1867 he again visited America, giving numerous readings and meeting with a brilliant reception. He was at the last engaged in writing a new novel, *The Mystery of Edwin Drood*, which was left unfinished. He died at Gadshill, June 9, 1870, and was buried in Westminster Abbey, June 14.

The work of Dickens has been variously estimated. All admit his great humor, but to some his pathos seems much overdrawn. He possessed immense creative power, the number of his characters running into the thousands. The essence of his art is caricature, and for comic effect he exaggerated the abuses he attacked. He was a great amateur actor, of a broad, slightly burlesque type; his method on the stage and on the page was the same. In character building he hit upon some oddity and transformed it into a delightful type never to be forgotten. Consult: Forster, *Life of Dickens* (London, 1872-74); Fields, *Yesterdays with Authors* (Boston, 1872); Kent, *Charles Dickens as an Actor* (London, 1872); *Letters*, ed. by Miss Hogarth and Miss Dickens (ib., 1880-82); Ward, *Dickens* (ib., 1882); Marzials, *Life of Charles Dickens* (1887); Pemberton, *Charles Dickens and the Stage* (ib., 1888); Gissing, *Charles Dickens: A Critical Study* (New York, 1898); Fitzgerald, *The History of Pickwick* (London, 1891); Kitton, *The Novels of Charles Dickens* (ib., 1897); Hughes, *Dickens as an Educator* (New York, 1900); Fitzgerald, *Life of Charles Dickens as Revealed in his Writings* (London, 1905); Chesterton, *Life of Charles Dickens* (New York, 1906); Thomson, *Bibliography* (Warwick, 1904); Lehmann, *Charles Dickens as an Editor* (New York, 1912); Pugh, *The Charles Dickens Originals* (London, 1912); P. H. Fitzgerald, *Memoirs of Charles Dickens* (London and New York, 1914). Essays and editions are numerous. Collected editions appeared in England in 1847, in 1861, and in 1874. One of the most recent editions is Kitton, *The Autograph Edition of Complete Works* (56 vols., New York, 1902).

**DICKIE, GEORGE WILLIAM** (1844- ). An American naval engineer. He was born at Arbroath, Scotland; studied mechanical and naval engineering, came to the United States in 1869, and was connected with steamship designing on the Pacific coast. From 1893 to 1905 he was manager of the Union Iron Works, San Francisco, Cal., and in that capacity became identified with the execution of much naval work for the United States government. In 1905 he became consulting marine and mechanical engineer of San Francisco. He was at one time president of the Technical Society of the Pacific Coast. He wrote *Pumping and Hoisting Works* (1876) and numerous papers and articles.

**DICKINS, JOHN** (1747-98). An American clergyman. He was born in London and was educated at Eton, but, removing to America before the Revolution, he became one of the

most efficient promoters of the Methodist Episcopal church in this country. A Latin, Greek, and Hebrew scholar, he had much to do with the founding of Cokesbury College at Abingdon, Md., the first institution of higher learning established by the Methodists. He preached in Virginia and North Carolina and in 1783 was sent to New York City to take charge of the John Street congregation. In 1789 he was transferred to Philadelphia, where he established the Methodist Book Concern. This was subsequently removed to New York. The first book published was *The Imitation of Christ* by a Kempis. Dickens did an important work in gathering and publishing the minutes of the annual Methodist conferences. Consult Atkinson, *Centennial History of American Methodism* (New York, 1884); also the volume entitled *Centennial of the Methodist Book Concern* (ib., 1890).

**DICKINSON, A** city and the county seat of Stark Co., N. Dak., 310 miles west of Fargo, a division point on the Northern Pacific Railroad (Map: North Dakota, B 4). The city contains a Carnegie library, a hospital, and a State agricultural experiment station. Its chief industries are stock raising, milling, the shipping of agricultural implements, wheat growing, and pressed brick works. Clay and lignite coal abound in the surrounding regions. First settled in 1880, its government in 1906 was vested in a mayor, elected biennially, and a unicameral council. It owns and operates its water works. Pop., 1900, 2706; 1910, 3678.

**DICKINSON, ANNA ELIZABETH** (1842- ). An American lecturer, author, and actress, born in Philadelphia. She became prominent through her fiery addresses on total abstinence, abolition, politics, and woman suffrage. After a time she devoted her whole attention to lecturing and to the drama, writing *A Crown of Thorns* (1876), in which she herself played; *True to Herself, and What Answer?* (1868), a novel; *Mary Tudor and Aurelan*, dramas; and *A Ragged Register of People, Places, and Opinions* (1879). In 1880 Fanny Davenport appeared with success in her *American Girl*.

**DICKINSON, DANIEL STEVENS** (1800-66). An American statesman, born in Goshen, Conn. He was admitted to the bar in 1828, was elected to the Senate of New York State in 1836, became Lieutenant Governor in 1842, and in 1844 was appointed by the Governor to a vacancy in the United States Senate. In 1861 he was elected Attorney-General of New York, and in 1865 was appointed district attorney for the southern district of the State. During the Civil War he actively supported the cause of the government. He was an able debater, and for a time leader of the Democratic party in New York. In the Republican National Convention of 1864 he received 108 votes for the vice-presidential nomination. Consult Dickinson's *Life and Works* (2 vols., New York, 1867).

**DICKINSON, DONALD McDONALD** (1846- ). An American lawyer and politician. He was born at Port Ontario, N. Y., graduated at the University of Michigan in 1867, and was admitted to the bar in the same year. He was Postmaster-General in 1888-89, chairman of the National Democratic Campaign Committee in 1892, and senior counsel for the United States before the Bering Sea Claims Commission in 1896-97. He was a member of the Court of

Arbitration to adjust the controversy between the United States and the Republic of Salvador in 1902.

**DICKINSON, EMILY** (1830-86). An American poet, born at Amherst, Mass. She lived a secluded life and published almost nothing during her lifetime. At her death T. W. Higginson, with Mrs. Mabel Loomis Todd, edited a volume entitled *Poems by Emily Dickinson* (1890), which attracted considerable attention and was followed by another volume of poems as well as by a volume of selected letters. In thought her introspective lyrics are striking, but are deficient in form. Her *Letters* (ed. by Mabel L. Todd) appeared in 1906.

**DICKINSON, G(OLDSWORTHY) LOWES**. An English writer on historical and religious topics, son of a well-known artist, Lowes Dickinson. He was educated at the Charterhouse and at King's College, Cambridge, of which he became fellow and lecturer. He also lectured at the London School of Economics and Political Science. Particularly felicitous in his use of the dialogue as a literary form, he wrote: *The Greek View of Life* (1890, 3d ed., 1906); *From King to King: The Tragedy of the Puritan Revolution* (1891; 2d ed., 1907), dialogues; *Revolution and Reaction in Modern France* (1892); *The Development of Parliament During the Nineteenth Century* (1895). *Letters from a Chinese Official* (1903; in England, 1901, called *Letters of John Chinaman*), which came out anonymously, being reprinted from the *Saturday Review*, and which was answered by William Jennings Bryan in his *Letters to a Chinese Official* (1906), taking seriously the Chinese authorship; *Religion: A Criticism and a Forecast* (1905); *A Modern Symposium* (1905) on philosophic schools of thought; *Justice and Liberty* (1908); *Is Immortality Desirable?* (1909); the Howard Ingersoll Lectures; *Religion and Immortality* (1911). Consult Chesterton's *Heretics* (London, 1909) for an interesting, but unsympathetic criticism of "Paganism and Mr Lowes Dickinson," and More, *Shelburne Essays*, vol. vii (New York, 1910).

**DICKINSON, JACOB MCGAVOCK** (1851- ). An American lawyer and cabinet officer, born at Columbus, Miss. After graduating from the University of Nashville in 1871, he studied law at Columbia Law School, the University of Leipzig, and in Paris. Admitted to the bar in 1874 he practiced in Nashville until 1899 and in Chicago from 1899 to 1909. Several times he was called upon to serve on the supreme bench of Tennessee by special commission. He was also Assistant Attorney-General of the United States (1895-97), Federal solicitor (1899-1901), and general counsel (1901-09) of the Illinois Central Railroad Company, and counsel for the United States before the Alaskan Boundary Tribunal (1903). From 1909 to 1911 he was Secretary for War in the cabinet of President Taft. He served as president of the American Bar Association in 1907-08.

**DICKINSON, JOHN** (1732-1808). An American statesman and publicist, known as the "Penman of the Revolution." He was born in Talbot Co., Md., but in 1740 removed with his father to Delaware. He began the study of the law in Philadelphia in 1750; entered the Middle Temple, London, England, in 1753, and in 1757 began practice in Philadelphia. In 1760 he became a member of the Delaware Assembly and in 1762 was elected to the Pennsylvania Assem-

bly, where he served with great distinction until 1765 and again from 1770 to 1776. He was also a member of the Stamp Act Congress and from 1774 to 1776 of the Continental Congress; served for a time in the American army, first as a private and afterward as a brigadier general in the Delaware militia; was Governor of Delaware from 1781 to 1782, again a member of the Continental Congress in 1779-80, and Governor of Pennsylvania from 1782 to 1785; and afterward took a prominent part in the debates of the Constitutional Convention of 1787, and in the discussions in Pennsylvania and Delaware over the ratification of the Constitution. He is best known, however, as a writer of state papers and pamphlets, in which capacity up to 1776 he ranked foremost among his contemporaries. Among the important state papers which he drafted or wrote were the "Resolutions in relation to the Stamp Act," adopted by the Pennsylvania Assembly in 1765; the "Declaration of Rights" and the "Petition to the King," adopted by the Stamp Act Congress; the "Essay on the Constitutional Power of Great Britain over the Colonies in America," adopted by the Pennsylvania Convention; the "Address of Congress to the Inhabitants of the Province of Quebec"; the "Petition of Congress to the King"; the "Declaration by the United Colonies of North America . . . Setting Forth the Causes and Necessity of Their Taking up Arms"; the "Articles of Confederation" (first draft); and the "Address of Congress to the Several States on the Present Situation of Affairs" (1779). In addition, he wrote numerous pamphlets and newspaper articles, the most famous of which were the celebrated *Farmer's Letters*, published at Philadelphia in 1767. These "letters" had a wide circulation and produced such an effect on both sides of the Atlantic that their appearance has been regarded as "the most brilliant event in the literary history of the Revolution." Dickinson's influence waned after 1776 on account of his opposition to the Declaration of Independence, which he refused to sign; but a series of papers written by him in 1787-88, under the pseudonym "Fabi-us," were widely read and contributed much towards inducing Pennsylvania and Delaware to ratify the Constitution. In the literature of the Revolution, says Ford, the editor of Dickinson's writings, he was "as preëminent as Washington in the war, Franklin in diplomacy, and Morris in finance." He helped to found Dickinson College at Carlisle, Pa., in 1783. His *Writings*, edited by Paul L. Ford, were published, in part, at Philadelphia in 1895. Consult Stillé, *The Life and Times of John Dickinson* (Philadelphia, 1891), and an excellent estimate of Dickinson's literary work in Tyler, *Literary History of the American Revolution* (New York, 1897).

**DICKINSON, JONATHAN** (1688-1747). An American clergyman. He was born in Hatfield, Mass., and graduated at Yale in 1706. He was for 30 years a Presbyterian minister in Elizabethtown, N. J., and was a leader in this denomination. In 1746 he became president of the College of New Jersey (now Princeton University), and its first sessions were in his home in Elizabeth. He wrote a number of theological works, collected at Edinburgh (1793).

**DICKINSON COLLEGE**. An institution for higher education, founded in 1783, under the auspices of the Presbyterian church at Carlisle,

Pa. The charter of the college was granted by the General Assembly of the State as a result of an appeal made by the leading men of the Commonwealth, including Benjamin Rush and John Dickinson. It was named after the latter "in memory of the great and important services rendered to his country . . . and for the commemoration of his very liberal donation to the institution." This donation was a plantation of 200 acres in York County, another 500 acres in Cumberland County, \$500 in cash, and a number of valuable books. The college began its work on April 6, 1784. Its first president was Rev. Charles Nisbet, D.D., and the faculty included, in addition to him, four instructors. In 1798 the present site of the college, comprising a town square, was purchased from the Penns for \$150. The first building erected on the site was destroyed by fire before its completion. By popular subscription funds were raised to erect another building, completed in 1804. This is known as West College. The college continued under Presbyterian auspices until 1833, when, on account of difficulties which overtook it, representatives of the Methodist Episcopal church agreed to become responsible for its continuance, and a board of trustees composed of representative Methodists, with Bishop John Emory as chairman, was elected. The college has since been under Methodist Episcopal auspices. In addition to West College, the college buildings are South College (1835), East College (1836); the Law School (1877), Tome Scientific Building (1884), Gymnasium (1884), Boesler Memorial Library Hall (1885), Denny Memorial Hall (1896). The college has adhered to approved courses of study based upon four years of preparation in a good preparatory school. The degrees given by the college *in cursu* are B.A. and B.S. The students numbered in 1913-14 about 325, and the faculty 15. The annual income amounts to about \$50,000. The president in 1914 was Eugene A. Noble.

**DICK'S COFFEE HOUSE.** A London coffee house, originally called "Richard's," after Richard Torner or Turner, who was its first proprietor (1680). The building still stands, on the south side of Fleet Street (No. 8), near the Temple.

**DICKSON, SIR JAMES ROBERT** (1832-1901). An Australian statesman. He was born at Plymouth, England, was educated in Glasgow, Scotland, and worked in the City of Glasgow Bank. He emigrated to Victoria in 1854, whence he removed to New South Wales and in 1862 to Queensland. In 1872 he was elected to the Queensland House of Assembly. In 1876 he entered the cabinet of Arthur Macalister as Minister of Public Works. He was Treasurer of the colony from 1876 to 1879 and from 1883 to 1887. From 1889 to 1892 he lived in Europe, returning in the latter year to conduct a campaign in favor of Polynesian labor in the Queensland sugar plantations. He was elected to the House of Assembly in 1892, 1893, and 1896. In 1897 he entered the Nelson cabinet as Secretary for Railways. In March, 1898, he became Secretary for Home Affairs, and in October following became Premier. He fought for an Australian commonwealth, secured a referendum of the question to the people, and after an active campaign obtained a majority at the polls in favor of federation. He resigned the premiership in November, 1899, but in December

became Chief Secretary in Robert Philp's ministry, and early in 1900 visited London as a delegate from Queensland to discuss the affairs of the proposed commonwealth. On his return to Australia he was selected Minister of Defense in the first federal cabinet and was made K.C.M.G., but died about a week after the inauguration of the new government.

**DICKSON, LEONARD EUGENE** (1874- ). An American mathematician, born at Independence, Iowa. After graduating from the University of Texas in 1893, he studied at the universities of Chicago, Paris, and Leipzig. He was instructor and assistant professor of mathematics in 1897-99 at the University of California, associate professor for a year at the University of Texas, and then assistant and associate professor at the University of Chicago until 1910, when he was appointed to a full professorship. He was also research assistant at the Carnegie Institution at Washington (1900). He became in 1910 one of the editors of the *Transactions of the American Mathematical Society* (of which he was a vice president in 1909-10), and of the *American Mathematical Monthly*. His publications include: *College Algebra* (1902); *Introduction to the Theory of Algebraic Equations* (1903); *Elementary Theory of Equations* (1914).

**DICKSON, deks'ón, BARON OSKAR VON** (1823-97). A Swedish merchant. He was born at Göteborg, of Scottish ancestry. He was a member of many learned societies, both in London and abroad, and gave liberal pecuniary support to North Pole enterprises, particularly those undertaken by Baron Nordenskjöld after 1868. In recognition of his distinguished public services he was ennobled in 1890, the title or Baron being conferred on him in 1885. Dickson Harbor and various other points in the Arctic regions have been named in his honor.

**DICKSON, SAMUEL HENRY** (1798-1872). An American physician. He was born in Charleston, S. C., graduated at Yale in 1814, and in 1819 received the degree of M.D. at the University of Pennsylvania. He was appointed to the professorship of the institutes and practice of medicine in the medical school of Charleston, S. C., in 1824; was professor of the practice of medicine in the University of New York from 1847 to 1850; in 1858 accepted the chair of the practice of medicine at Jefferson College in Philadelphia. His publications include: *Elements of Medicine* (1835); *Essays on Life, Sleep, Pain, etc.* (1852); *Studies in Pathology and Therapeutics* (1867).

**DICKSON, WILLIAM PURDIE, D.D.** (1823-1901). A Church of Scotland theologian. He was born at Pettinain Manse, Lanarkshire, Oct. 22, 1823; graduated at St. Andrews; was from 1863 to 1895 a divinity professor in Glasgow University, and then professor emeritus. Besides translating Mommsen's *History of Rome* (4 vols., rev. ed., 1895) and *Roman Provinces* (1887), and Meyer's *Commentary on the New Testament* (10 vols., 1873-80), he delivered the Baird lectures of 1883, *St. Paul's Use of the Terms Flesh and Spirit* (1883).

**DICKSON CITY.** A borough in Lackawanna Co., Pa., 4 miles north of Scranton, on the Delaware and Hudson Company, and the New York, Ontario, and Western railroads (Map: Pennsylvania, K 3). It is in a coal-mining region and has foundries and machine shops and silk mills. It is governed by a burgess and a unicameral

# DICOTYLEDONS

1. MORNING-GLORY (*Ipomoea* sp.).

2. A HEATHER (*Cassiope* sp.).

3. ARNICA (*Arnica* sp.); *a*, general habit; *b*, ray-flower; *c*, disk-flower.

4. CATNIP (*Nepeta Cataria*); *a*, general habit; *b*, single flower.

council. Pop., 1900, 4948; 1910, 9331; 1914 (U. S. est.), 11,198.

**DICLINOUS PLANT** (Gk. *di-*, *di-*, double + *κλίσις*, *klinein*, to incline). A plant which has stamens and pistils in separate flowers. If the two kinds of flowers are on the same individual, the plant is called monœcious; if on different individuals, dioecious. See POLLINATION.

**DICOTYLEDONS** (Neo-Lat., from Gk. *di-*, *di-*, double + *κοτυλήδων*, *kotyledōn*, cup-shaped, hollow, from *κοτύλη*, *kotylē*, cavity). One of the two great divisions of Angiosperms (q.v.). The Angiosperms are the most advanced, the most recent, the most conspicuous, and the most useful of plants. Approximately 130,000 species of Angiosperms have been described, about 105,000 of which are Dicotyledons. The chief characters which distinguish them from Monocotyledons, the other group of Angiosperms, are an embryo with lateral cotyledons (usually two); the vascular bundles of the stem forming a hollow cylinder, which means an annual increase in the diameter of woody stems; an open system of venation, which means that the veinlets end freely in the tissues of the leaf or in the margins, often resulting in various forms of toothed, lobed, and branching; and flowers whose tendency is to display their parts in fives or fours or their multiples.

Two great groups of Dicotyledons are recognized—the Archichlamydeæ and the Sympetaleæ. In the former there is either no perianth (calyx and corolla), or its parts are separate (polypetalous); in the latter the corolla is sympetalous (petals coalesced). Formerly the Archichlamydeæ were divided into two groups—the Apetaleæ, in which there are no petals, and the Polypetalæ, in which petals are present; but this division has been found to be too artificial to stand, as several natural families have both apetalous and polypetalous members.

**Archichlamydeæ.** This vast group contains approximately 62,000 species and 180 families. They are the primitive Angiosperms from which both the Monocotyledons and the Sympetaleæ have been derived. At present they are grouped under 26 great orders. The first 12 orders, including about 6000 species, include many of the most common trees, as willows, walnuts, beeches, oaks, etc. Many of these were formerly grouped as Amentifereæ, a name referring to the characteristic flower cluster called ament, or catkin. This group of 12 orders does not seem to be related to any of the higher ones. Orders 13 and 14 also represent an apparently isolated group, including such plants as smartweeds, pigweeds, pinks, etc. Order 15 (Ranales), with approximately 4000 species, is the great genetic order, which means that all the higher orders are thought to have been derived from it. Familiar families are buttercups, water lilies, magnolias. This order has not only given rise to the higher Archichlamydeæ and to the Sympetaleæ, but also to the Monocotyledons. Orders 16 and 17, with approximately 3000 species, represent special branches from Ranales, the most specialized one probably being the mustards. Order 18 (Rosales), with over 15,000 species, is the greatest one among the Archichlamydeæ, with approximately 12,000 species. Another prominent family is the rose family, which gives the name to the order. Orders 19-25, including nearly 30,000 species, represent a tangle of relationships leading off

in every direction from the preceding order. Order 26 (Umbellales), with over 25,000 species, is the highest one of the Archichlamydeæ. The dominant family is the parsley family, and associated with it are the dogwoods.

**Sympetaleæ.** This is a much better defined group than the Archichlamydeæ, from which it is derived, including approximately 43,000 species in 51 families, which are grouped under eight orders. The sequence of orders from lowest to highest is as follows: Ericales, with approximately 1700 species, include the heaths, so characteristic of northern latitudes. Primulales, with approximately 1000 species, are represented by the primroses. Ebenales, with nearly 1000 species, are mostly tropical shrubs and trees, represented in the northern flora by the persimmon, but, as the name suggests, the characteristic family is the ebony family. Gentianales, with over 4000 species, are characterized by the gentians, from which the highly specialized milkweeds have come. Tubiflorales, with nearly 15,000 species, include those plants with conspicuous tubular corollas which are often irregular, and are represented by morning glories, polemoniums, mints, figworts, etc. Plantaginales, containing only about 200 species, comprises only the cosmopolitan plantains. Rubiales, with nearly 5000 species, are characterized by the madders, and associated with them are the honeysuckles. Finally, the Campanales, with about 14,500 species, stand as the highest order of Angiosperms, which means the culmination of the plant kingdom. The dominant family is known as the Composite, which includes such forms as sunflowers, asters, goldenrods, dandelions, etc. This great family is not only highest in rank, but greatest in numbers, including 12,500 species.

**DICTAMNUS.** See DITTANY.

**DICTATOR** (Lat., from *dicere*, to dictate, frequentative of *dicere*, to say). In the earliest times, the name of the highest magistrate of the Latin confederation; and in some of the Latin towns the title was continued long after these towns were subjected to the dominion of Rome. In the Roman Republic the dictator was an extraordinary magistrate, irresponsible and endowed with absolute authority, whose original name was *magister populi*. This title, it has been suggested, described the dictator as head of the (infantry) host; at any rate, his chief subordinate was regularly known as *magister equitum*. In this view the dictatorship was a military office. Later, at times a dictator was appointed to suppress civil strife. The frequency of *crises*, or critical periods, in the quick, aggressive growth of the Roman state, necessitated such an office. The first dictator (T. Larcus or M. Valerius) was appointed in 501 B.C., nine years after the expulsion of the Tarquins. According to Livy, the immediate cause of this dictatorship was a formidable war with the Latins. In general no one could be appointed dictator who had not been previously consul, and this condition was very rarely dispensed with. It is possible that the dictator was originally created or elected by the curiæ, like the kings; but it is more probable that the Senate passed a decree ordering one of the consuls to name or proclaim (*dicere*) a dictator. Originally, of course, the dictator was a patrician; the first plebeian to fill the office was Marcus Rutilius (356 A.C.), who was nominated by the plebeian consul, M. Popillius Lænas.

The dictatorship could not lawfully be held longer than six months; nor was it ever held for a longer period, except in the cases of Sulla and Cæsar, which were altogether peculiar. During a dictatorship the consuls and other regular authorities continued to discharge their proper duties, but in subordination to the dictator, being for the time simply his officers. The superiority of his power, when compared with that of the consuls, appears chiefly in three points: he was far more independent of the Senate; he had a more extensive power of punishment, without any appeal; and he could not be called to account after his abdication of the dictatorship for anything he had done during the period of his office. The limits of his power were as follows: he could not touch the treasury; he could not leave Italy; and he could not ride through Rome on horseback without previously obtaining the permission of the people. While the consuls had only 12 lictors, the dictator was preceded by 24, bearing the *securæ* and *fascæ*. To him also belonged the *sella curulis* and the *toga prætexta*. The last legally elected dictator was M. Junius Pera, who entered on his office 216 B.C. From this time nominal dictators were frequently appointed for the purpose of holding the elections, but even these finally disappeared (202 B.C.). Henceforth, in critical times, a sort of dictatorial power was conferred on the consuls by the Senate by the well-known formula: "That the consuls should see to it that the state should receive no damage." This practice rendered the appointment of dictators no longer necessary. In 44 B.C. Antonius carried a law making the dictatorship no longer a part of the Roman constitution. Consult Mommsen, *Römische Staatsrecht*, ii, 133 ff. (3d ed., Leipzig, 1887), and Greenidge, *Roman Public Life* (London, 1907).

The term is loosely applied in modern use to a ruler enjoying or exercising extraconstitutional power. Gen. Porfirio Diaz and Gen. Venustiano Huerta were styled Mexican dictators.

**DICTIONARY** (ML. *dictionarius*, word book, from Lat. *dictio*, word, from *dicere*, to say). In its original and most common application, a work which is linguistic in character, being a compilation of all or a portion of the words of a language arranged according to some exact order, usually the alphabetical one, with brief explanations and definitions. In later and more elaborate dictionaries additional information of an appropriate character is included within the scope of the work. Thus, etymologies, indications of pronunciation, and variations in orthography may be given, while a still further expansion includes citations which illustrate the uses of words. The name is said to have been used for the first time by Joannes de Garlandia, who died in 1252 A.D. He described his book containing a classified list of words as a *dictionarius*. In its use the word "dictionary" is no longer confined to a simple linguistic compilation, but is applicable to works on special or technical subjects, which, through the medium of an alphabetical classification of words belonging to that subject, give appropriate and detailed information. Such dictionaries are very numerous; and we have biographical, historical, bibliographical, geographical, philosophical, mathematical, zoological, medical, musical, architectural, and other dictionaries.

The following terms are more or less synonymous with the word "dictionary": *vocabulary*, which is a list of words restricted to a single work or to some division of the language, e.g., the vocabulary of Cæsar's *Gallie War*; *lexicon*, a word applied by English-speaking peoples to a dictionary of some foreign language, as Hebrew, Greek, or Latin; *glossary*, a partial dictionary of words of a certain dialect or of antiquated or technical terms accompanied by glosses or explanations; *thesaurus* (*verborum*)—i.e., a treasury of words—an elaborate dictionary with many references and full explanations. More unfamiliar are *idioticon*, from Greek *ἰδιώτης*, *idiotikos*, belonging to an individual, and *onomasticon*; the former, common in Germany, indicates a dictionary of words of a dialect; the latter, from the Greek *ὄνομα*, *onoma*, name, is a dictionary of names, as the *Onomasticon* of Julius Pollux of the second century—a Greek dictionary in 10 books containing words arranged according to their meaning. *Index* (q.v.) is a list of names, topics, etc., generally placed at the close of a book to indicate more exactly and definitely the contents thereof. The *gazetteer* and *concordance* should be mentioned as having certain characteristics of dictionaries. The first is a geographical dictionary with names of places, seas, rivers, etc., in alphabetical order, accompanied with a brief account of each. The word "gazetteer" was first used by Lawrence Echard, whose work was entitled *The Gazetteer*; or, *Newsman's Interpreter*—A *Geographical Index* (11th ed., London, 1716). In part it is the author speaks of his work as "The Gazetteer." A concordance is an index of various passages in a book classified according to certain leading words arranged in an alphabetical order. As this was first made for the Bible, Johnson defines it as "a book which shows in how many texts of Scripture any word occurs." As examples, we may cite: Cruden, *A Complete Concordance to the Old and New Testaments* (London, 1859); Clarke, *Concordance to Shakespeare* (ib., 1827); Brightwell, *A Concordance to the Entire Works of Alfred Tennyson* (ib., 1869).

**History.** The earliest dictionary of which there is any mention is that made in Nineveh in the reign of Assurbanipal in the seventh century B.C., which is impressed on a number of clay tablets in cuneiform letters. Arabic scholars early busied themselves with dictionary making, a work very necessary for a language as rich as theirs. The first to attempt to gather the entire Arabic vocabulary in one work was probably Khalil ibn Ahmed of Oman (died 791), who adopted an arrangement not alphabetical, but one based on certain phonetic and physiological principles. The worthiest of Khalil's many successors were Mukarram ibn Mansur, an Egyptian (died 1311), and al-Firuzabadi, a Persian by birth, whose travels entitled him to be called a citizen of the Oriental world (died 1414). The work of the former (Cairo, 1300 et seq.) filled 20 volumes, while the *Camus* ('dictionary') of the latter, preserved only in part, extended to 60 (according to some accounts, to 100) volumes. While in a certain sense Hebrew lexicography began with the Massoretic (sixth to eighth centuries), the real production of Hebrew dictionaries began in the tenth century, taking its origin in, and being stimulated by, the study of Arabic. Rabbi Saadia Gaon (died 942) was the first Hebrew lexicographer;

David Kimchi (c.1200), author of the *Book of Roots*, was the greatest. Menahem ben Sarug (c.960) made a dictionary arranged according to stems. Judah Hayyuj (c.1000) propounded the theory of triliteral roots, and his work was continued by Rabbi Jonah (Ibn Janah, c.1030). Sanskrit dictionaries begin at a very early date in the glossary of Yaska to the Rig-Veda (about the fifth century B.C.) and continue to be for the most part collections of rare words and meanings, being designed especially for the authors who composed the artificial poetry so prevalent in India. These dictionaries, most of them written after the fifth century A.D., are invariably in verse and are divisible into the two general classes—lexicons of synonyms and homonyms. Alphabetical arrangement begins only in the latter period of the homonymous dictionaries. The older works of this class arrange the words in order of importance, while in the synonymous dictionaries words are classified according to subjects. Other modes of classification are according to the number of syllables in the word, its gender, or its final letter.

The number of native Sanskrit lexicons is over 50, and of them the *Amara-kōṣa* (see AMARASINHA) is the most frequently quoted. There are also special dictionaries on botany, medicine, and astronomy, as well as Buddhist glossaries in Pali, and polyglot lexicons in Sanskrit, Tibetan, Mongolian, and even Chinese. (Consult Zacharie, *Indische Wörterbücher*, Strassburg, 1897.) Of Old and Middle Iranian (Avestan and Pahlavi) there are but two native dictionaries—one Avestan-Pahlavi, and the other Pahlavi-Pazand (both edited by Haug and Jamaspji, Bombay and London, 1867-70; the former also by Reichelt, Vienna, 1900). In Modern Persian there is a long list of lexicons, both general and special, based upon Arabic models, the oldest one, perhaps, written by Asadi, Firdusi's teacher, dating from the eleventh century. In the classical languages, Greek and Latin, we find evidences of lexicographical work at an early period.

But dictionaries of language in a form with which we are familiar are of modern origin. They are an outgrowth of the importance of Greek and Latin literature to the scholars of the Middle Ages and may be traced to the mediæval custom of inserting marginal glosses or explanatory words in texts of classical authors. The bilingual dictionary in particular is due to the closer intercourse of the various nations of the more modern world. The Greeks and Romans did not conceive of a work containing all the words of their own or of a foreign language, and their early dictionaries were simply glossaries of unusual words or phrases. Athenæus tells of Alexandrian scholars such as Zenodotus, librarian of the great library, who compiled books containing foreign phrases and a glossary of Homer; and of Artemidorus of 240 B.C., who prepared a book of technical terms on cooking. All these have been lost. According to Sudas, Apollonius, the Sophist of the days of Augustus, wrote the earliest Greek lexicon, which was entitled *Ἄλφειν Ὀμῆρικαι*, (*Lexicæ Homériques*), or *Homeric Words*, published last by Bekker, of Berlin, in 1833. This is the most ancient dictionary extant. Other Alexandrian lexicographers were Ælius Mæris (190 A.D.); the Atticist, who wrote a Greek (Attic) lexicon (ed. by Hudson, Oxford, 1712),

and Harpocration (fourth century), who composed a lexicon of the Attic orators (ed. by Dindorf, ib., 1853).

Ammonius, professor of grammar at Alexandria, prepared a book of homonyms, published by Valekenær in 1739 (also Leipzig, 1822). In this same book is edited the work of Zenodotus on the cries of animals, which is similar to Vincenzo Caralucci's *Lexicon Vocum quæ a Brutis Animalibus Emitteruntur* (Perugia, 1779). Hesychius of Alexandria, of the latter part of the fifth century A.D., wrote a lexicon, based supposedly on that of Pamphilus (another Alexandrian grammarian), containing short explanations of Greek words with quotations from authors. The first edition is the Aldine (Venice, 1514); the latest, that of Schmidt (Jena, 1867). Orion, of Thebes, Egypt, of about the same period, wrote an etymological dictionary, which was last printed in 1820 at Leipzig by Sturz. Erotian, a physician of Nero, prepared a lexicon on Hippocrates arranged in alphabetical order by a later writer and edited by Klein at Leipzig in 1865. Julius Pollux, of Naucratis, Egypt, who was made professor of rhetoric at Athens by the Emperor Commodus, wrote the *Onomasticon* referred to above, which is a work of great value for the language and for the study of antiquities. It first appeared in the Aldine edition (Venice, 1500) and long after (1824) in a Leipzig edition by Dindorf. The most famous of Greek writers of glossaries is Suidas, whose period is thought to be the tenth century A.D. He prepared an alphabetical dictionary of words, with place and personal names and many quotations from Greek writers and scholars. This book was first printed at Milan in 1499 and again in an excellent edition by Bernhardy at Halle in 1833. Other Byzantine lexicographers are Photius of the ninth century (ed. by Naber, Leyden, 1864), and John Zonaras, a celebrated twelfth-century historian and theologian (ed. by Tittmann, Leipzig, 1808). In 1848 Gaisford, at Oxford, published a Greek glossary of the eleventh century known as *Etymologicum Magnum*, which contains numerous passages from various famous writers and copious historical and mythological references. Eudocia Augusta, of Macrembolis, wife of Constantine XI and Romanus IV (1059-71), is credited with the compilation of an historical and mythological dictionary which she called *Ἱστορίαι, Ἰόνισα, 'Bed of Violets'*. In the work of Crastoni, a native of Piacenza, we have the first Greek and Latin lexicon. There is an Aldine edition of 1497. To the same time belong Guarina's *Thesaurus* and a similar work by Thomas, who was known as the monk Theodolus. In 1572 at Geneva appeared the *Thesaurus Græcæ Linguae* of Henri Estienne (Stephanus), reedited by Valpy at London in 1816-26 (6 vols.) and by Dindorf at Paris in 1831-65 (9 vols.). This is the most complete Greek lexicon ever published. The first Greek-English lexicon is that of John Jones (London, 1823), although the work of John Pickering, which was not completed, bears the date 1814. The most useful Greek-English lexicon is the Liddell and Scott (8th ed., New York, 1897); also in abridged form. Pape, *Wörterbuch der griechischen Eigennamen* (Brunswick, 1875-80) is of value for proper names. Special Greek lexicons worthy of mention are: *Greek-English Lexicon of the New Testament*, by J. H. Thayer, a revision of Grimm's Wilke's *Clavis Novi Testamenti* (London, 1889); *Greek Lexicon of the*

*Roman and Byzantine Periods*, by E. A. Sophocles, revised by J. H. Thayer (ib., 1887), and for modern Greek, Δεξιόν Ἑλληνοαγγλικόν, *Modern-Greek-English and English-Modern-Greek*, by Contopoulos (3d ed., Athens, 1889).

In Latin lexicography we think first of M. Terentius Varro, who wrote *De Lingua Latina*, a work on etymology and the uses of words; then of Verrius Flaccus, living in the days of Augustus, who wrote *De Verborum Significatu*, which is extant in the compilation of Pompeius Festus, entitled *De Significatione Verborum*, abridged by Paulus Diaconus of the eighth century. This work, in which the words are arranged alphabetically, has been of great service in giving information on antiquities and grammar. Less familiar are the dictionary of Papias of the eleventh century, based on glossaries of the sixth and seventh, and the *Catholicon* or *Summa* of Giovanni Balbi, dating about 1286 and, as printed by Gutenberg in 1460, now a curiosity. It passed through 20 editions. The earliest polyglot was the work of an Augustine monk, Colepinus, dated at Reggio, 1502. At first it was a Latin-Greek lexicon, then came to be extended to include Italian, French, and Spanish, and finally in the 1590 Basel edition it included 11 languages. The great Latin dictionaries are *Thesaurus Linguae Latinae* of Robert Etienne (Paris, 1631, reëdited down to 1734), and the *Totius Lexicon Latinitatis* by Forcellini (Padua, 1771, an edition published with the names of Faccioliati and Forcellini as editors; 3d ed., 1831). In this work the Latin words are given Greek and Italian equivalents and are illustrated by examples from classical literature. The latest (fifth) edition is that of De Vit (Prato, 1858-79), with the *Onomasticon Totius Latinitatis* as a supplement. This is the greatest of all Latin lexicons. The first Latin-English lexicon of any account was edited by Sir Thomas Eliot (London, 1538; 3d ed., 1545). Before this there had appeared the *Promptorium Parvulorum* by Galfridus Grammaticus (1409), the *Medulla Grammatica* in manuscript (1483), and the *Ortus Vocabulorum* of Wynkyn de Worde (1500), of which there were 13 editions between 1509 and 1523. Then in 1552 a Richard Huloet published his *English-Latin Abecedarium*, with English definitions; in 1570 appeared *Manipulus Vocabulorum Puerorum*, a rhyming dictionary of English and Latin words by Peter Levins; and finally came the *Alvearie* by John Baret, which had three languages—English, Latin, French. In 1736 Robert Ainsworth published his *Latin-English Dictionary*, which passed through many editions. The best Latin lexicons of to-day are: *Latin-English Dictionary*, White and Riddle (London, 1880), and *English-Latin Dictionary* (ib., 1869); Harper's *Latin Dictionary*, which is based on Freund's *Latin-German Lexicon*, in English, by Andrews (New York, 1856), and which is revised by Lewis and Short (ib., 1886); Georges, *Deutsch-Lateinisches und Lateinisch-Deutsches Wörterbuch* (4 vols., Leipzig, 1880-85). This last is most accurate and satisfactory and, next to the Forcellini, contains the most words of all Latin lexicons. The greatest Latin lexicon of modern times is the *Thesaurus Linguae Latinae* (Leipzig, 1900 et seq.), which is due mainly to the genius of Edward Wölfflin of Munich. It is edited, under the supervision of the five great German academies—those of Berlin, Göttingen, Leipzig, Munich, and Vienna—by the most distinguished

classical scholars of Germany. For mediæval Latin the only lexicon of importance is the *Du Cange, Glossarium ad Scriptores Mediæ et Infimæ Latinitatis* (1733-36, ed. by Henschel; 16 vols., Paris, 1882-88).

**English Dictionaries.** The earliest work on lexicography in England aimed to extend our knowledge of Latin. To such an aim are due the Latin-English dictionaries of the latter period of the fifteenth century and the beginning of the sixteenth, mentioned above. With a similar purpose Minsheu in 1617 published his great polyglot *Guide to the Tongues*, explaining English words by those from 10 foreign languages. The *English Expositor* of John Bullokar (1616) was the first English dictionary in the strict sense of the term, as it gave both words and definitions in English. In the seventeenth century we find the *English Dictionarie* of Henry Cockeram (1623); the *Glossographia* of Thomas Blount (1656); *The New World of English Words* by Phillips (1658); and the *English Dictionary* of Elisha Coles (1677). In the early part of the eighteenth century appeared the first dictionary aiming to give a complete collection of words of the language—the *Universal Etymological English Dictionary* of Nathan Bailey (1721). In his preface to the first volume the author declares that he is the first to attempt in English to trace the derivation of English words on a large scale, although he refers to the work of Blount in his *Glossography* and to that of Skinner in his *Etymologicon* (1671). He also marked accents to aid in pronunciation. Bailey's dictionary passed through 24 editions before the close of the century and was the standard until the publication of Johnson's Dictionary. In 1755 Dr. Samuel Johnson, after seven years of labor, published his famous dictionary. This was a most remarkable achievement and was epoch-making in the history of the language, for it determined the form, meaning, and use of English words. Dr. Johnson also introduced the custom of illustrating the use of words by quotations from the best writers. This work passed through many editions, of which the last is that of Robert Gordon Latham (London, 1866), which is to-day only of historic interest. Johnson's Dictionary simply imitated Bailey's in the use of accents to indicate pronunciation. The first dictionary to give attention to orthoëpy is that of Kenrick (London, 1773). Perry, *Royal Standard English Dictionary* (Boston, 1777), and the *Complete Dictionary of the English Language* by the famous elocutionist, Thomas Sheridan (London, 1780), followed suit. The object of the latter work is stated to be "to establish a plain and permanent standard of pronunciation." In 1791 John Walker published his *Critical Pronouncing Dictionary and Expositor of the English Language*. In this work pronunciation is the main object, the author declaring his design to be "to give a kind of history of pronunciation and to register its present state." This dictionary has had a wide circulation and still has a reputation, although it is not, of course, a reliable guide for present-day pronunciation, but rather supplies information as to the pronunciation at the beginning of the nineteenth century. In 1836 B. H. Smart published his *New Critical Pronouncing Dictionary of the English Language*, designated also as "Walker Remodelled." *The New Dictionary* by Richardson, published also in London

in 1836 (new ed., New York, 1863), is valuable for many citations from authors in chronological arrangement, which have, unfortunately, been abridged in the later edition. The *Imperial Dictionary of the English Language* by John Ogilvie (London, 1850) is an encyclopedic lexicon—literary, scientific, and technological. A new edition by Charles Annandale was published in 1883. This formed the model of the *Century Dictionary*, mentioned below. Similar to the *Imperial Dictionary* is the *Encyclopedic Dictionary* by Robert Hunter (London, 1879-88). In 1806 Noah Webster published his *Compendious Dictionary*, and in 1828 he brought out his great *American Dictionary of the English Language*, which was followed by abridged editions. Besides many editions containing minor changes, complete revisions of the large dictionary were made in 1847 by Chauncey A. Goodrich and in 1864 and 1890 by Noah Porter. Its present name is *Webster's New International Dictionary* (copyright, 1909). This is a complete revision of the entire work. It has an appendix with a valuable introduction and a pronouncing biographical dictionary and pronouncing gazetteer. The Webster dictionaries were the pioneer works in lexicography in the United States. The *Dictionary of the English Language*, by Joseph E. Worcester, dates from 1859 and was last revised in 1881, so that it is now largely out of date. The last edition (1886) contains a supplement of 12,500 words. The introduction contains a History of English Lexicography and a Catalogue of English Dictionaries. In 1898 appeared the *Webster's Collegiate Dictionary* (an 8vo abridgment from the *International*), which underwent radical revision, based upon the *New English Dictionary* mentioned below, and was published again in 1913. In its present form the octavo Webster is perhaps the most reliable small dictionary in the English language. In 1889-95 appeared the *Century Dictionary*, an encyclopedic English lexicon of 7046 pages, based upon *Ogilvie's Imperial Dictionary* (mentioned below) and prepared under the direction of Dr. W. D. Whitney, together with an added *Dictionary of Proper Names* of 1085 pages, edited by B. E. Smith, and geographical atlas. This was revised and published together, under the editorship of B. E. Smith, in 1911. A small, one-volume *Century Dictionary*, based upon the larger work and thoroughly compared with the great Oxford dictionary, is to be published. In 1893-95 appeared the large one-volume (2 vols. when first published) *Standard Dictionary of the English Language*, under the editorship of Isaac K. Funk and Francis A. March. This has been thoroughly revised for the new edition, published in 1913. The great work, *A New English Dictionary on Historical Principles*, founded mainly on material accumulated by the English (British) Philological Society, was at first edited by James A. H. Murray, but later there have been associated with him Henry Bradley and W. A. Craigie. It is the greatest of all dictionaries in its fullness of illustration by citations and elaborate analysis of the meanings and etymologies of the words treated. The great scope and scholarship of this work is such that, although begun in 1884, it is still uncompleted—the letters T and S, being done simultaneously under separate editorships, were in 1914 still unfinished; in July the work was practically completed to the letter U. It is strongest in literary and ety-

mological matters and covers systematically the period from 1200 A.D. to date.

There are many dictionaries on special subjects, and their number is rapidly increasing, both in English and in many of the foreign languages. Some of the more important special dictionaries in English are: **ARCHITECTURE AND BUILDING**—Sturgis, *Dictionary of Architecture and Building* (3 vols., 1901-02). **BIBLE**—*Dictionary of the Bible*, by James Hastings (5 vols., 1898-1904); T. K. Cheyne and J. S. Black, *Encyclopaedia Biblica* (4 vols., 1900-03). **BIOGRAPHY**—Appendices to *Webster's International Dictionary*, *Standard Dictionary*, and *Century Dictionary*; Stephen (1885-91) and Lee (1891-1901), *Dictionary of National Biography* (66 vols., 8vo, including 3 supplementary vols., London, 1885-1901), and *Index and Epitome* of this (ib., 1903; 2d ed., 1906)—a new edition of this monumental work was published in 22 volumes (ib., 1908-09), with a new *Index and Epitome* (ib., 1913); Adams, *Dictionary of American Authors* (New York, 1898; 5th ed., revised and enlarged, ib., 1905); *Who's Who: Who's Who in America*; in German, *Wer Ist's* (these last three being revised annually); Thomas, *Universal Pronouncing Dictionary of Biography and Mythology* (new 3d ed., Philadelphia, 1910). **BIRDS**—Newton and Gadow, *Dictionary of Birds* (new ed., 1899). **CHEMICALS AND CHEMISTRY**—(i. H. Hurst, *Dictionary of Chemicals and Raw Products Used in Manufacture of Paints, etc.* (1901); A. I. Cohn, *Dictionary of Tests and Reagents* (1903); Watts, *Dictionary of Chemistry* (4 vols., 2d ed., 1888-94); Thorpe, *Dictionary of Applied Chemistry* (new ed., 5 vols., New York, 1912-13); Rawson, Gardner, and Laycock, *Dictionary of Dyes and Morants* (1901). **DIALECTS**—Wright, *The English Dialect Dictionary* (1898-1905), including a grammar of English dialects (a quarto work in 6 large vols.). This, like the Oxford *New English Dictionary*, is the most complete dictionary of its kind ever published. It is founded on the publications of the English Dialect Society and a large amount of new material gathered from new contributors and voluntary readers throughout Great Britain and Ireland. It contains a very complete vocabulary of all dialect words or senses now in use or known to have been in use since the beginning of the eighteenth century, with copious illustrative citations. Then there are also Bartlett, *Dictionary of Americanisms* (4th ed., revised and enlarged, Boston, 1896); Farmer, *Americanisms, Old and New* (New York, 1899), the latter very incomplete. **ECCLIASTICAL SUBJECTS**—Addis and Arnold, *A Catholic Dictionary* (6th ed., London, 1903); Hook, *A Church Dictionary* (15th ed., London, 1896). **GEOGRAPHY AND PLACE NAMES**—Heilprin, *Lippincott's Gazetteer of the World* (2d ed., large 8vo., Philadelphia, 1906; supp., 1911); Chisholm, *Times (London) Gazetteer* (reissue, ib., 1906); Blackie, *Dictionary of Place Names*, with derivations (ib., 1887). **HISTORY, ETC.**—Haydn, *Dictionary of Dates* (25th ed., New York, 1911); *Dictionary of Races and Peoples* (Washington, 1907). **MEDICAL**—Gould, *Illustrated Dictionary of Medicine* (6th ed., New York, 1910); Dunglison (ed.), *Dictionary of Medical Science* (23d ed., ib., 1903); Harris, *Dictionary of Dentistry* (6th ed., ib., 1899). **MUSIC**—L. C. Elson, *A Dictionary of Music* (Boston, 1905); Grove, *Dictionary of Music* (revised ed., 5 vols., New York, 1904-10). **MYTHOLOGY**—Harper's *Dio-*

*tionary of Classical Literature and Antiquities* (New York, 1898); J. Dawson, *Dictionary of Hindu Mythology, etc.* (London, 1903). MILITARY AND NAVAL.—J. P. Wisser and H. C. Gauss, *A Military and Naval Dictionary* (New York, 1905). NEEDLEWORK.—Caulfield and Saward, *Dictionary of Needlework* (London, 1885). PHILOSOPHY AND PSYCHOLOGY.—Baldwin, *Dictionary of Philosophy and Psychology* (new ed., 3 vols., New York, 1911); in French, Pierre Nova, *Dictionnaire de terminologie scolastique* (Paris, 1885; out of print). ECONOMICS.—Palgrave (ed.), *Dictionary of Political Economy* (revised ed., London, 1910). PROPER NAMES IN FICTION, HISTORY, ETC.—Harbottle, *Dictionary of Historic Allusions* (2d ed., London, 1904). QUOTATIONS.—Dalbiac, *Dictionary of German Quotations* (London, 1906); Harbottle and Dalbiac, *Dictionary of French and Italian Quotations* (2d ed., ib., 1904); Harbottle, *Dictionary of Classical Quotations* (3d ed., New York, 1906); Harbottle and Hume, *Dictionary of Spanish Quotations* (ib., 1907). SLANG.—Barrère, Albert, and Leland (eds.), *Dictionary of Slang, Jargon, and Cant* (London, 1907); Farmer and Henley, *Dictionary of Slang and Colloquial English* (ib., 1905). This is a one-volume abridgment of the larger work *Slang and its Analogues*, edited at first by John S. Farmer, later by him and W. E. Henley, as joint editors, containing many illustrative citations (7 vols., 1890-1904). SYNONYMS.—Crabb, *English Synonyms* (1st ed., London, 1816). This work contains a considerable body of selected citations and has extended discriminations between words that are more or less synonymous. It has passed through many editions practically unchanged and, though not a scholarly work, is still perhaps the best book of the kind for English synonyms. Based upon and largely taken from it, is Smith's *Synonyms Discriminated* (London, 1882), a book of the same general character. Other dictionaries of synonyms, without citations and consisting essentially of mere lists of words more or less related in meaning, are: Roget, *Thesaurus of English Words and Phrases Classified* (1st ed., London, 1852; new editions, enlarged and improved, have appeared in 1911 and 1913, both containing a full index by J. L. Roget)—this is considered by many a more discriminating and hence more helpful work than even Crabb's; Soule, *Dictionary of English Synonyms* (New York, 1871, 1891, 1910, 1911); Fernald, *English Synonyms and Antonyms* (1896, 1906); Fleming, *Synonyms, Antonyms, and Associated Words* (ib., 1913). The best treatments of English synonyms at present are those contained in the larger dictionaries (the *International*, the *Standard*, and the *Century* dictionaries). TECHNOLOGICAL.—Goodchild and Tweney, *Technological and Scientific Dictionary* (London, 1905).

The best dictionaries from English into foreign languages and vice versa, and the dictionaries entirely in foreign languages will be found in the bibliographies given under the various special articles in this ENCYCLOPEDIA; thus, under the article PORTUGUESE LANGUAGE will be found a list of the best native and bilingual dictionaries of Portuguese; and the case is similar with other like articles, such as SPANISH LANGUAGE, ITALIAN LANGUAGE, ETC. Several really great foreign dictionaries should be mentioned here, however. Among these is the great German dictionary, *Deutsches Wörterbuch*, of Jacob and Wilhelm Grimm, begun in 1852, of which the first volume

was published in 1854. It aims to give the words only of the literary language (being far less full than the *New English Dictionary*), from the beginning of the sixteenth century. Since the death of the Grimm Brothers the work has been carried on by other scholars. The work is now (1914) about five-sixths completed. Among the monumental French dictionaries we have *Dictionnaire de la langue française*, by M. P. E. Littré, a large quarto rich in literary citations and the history of French words, published in Paris in 1863-72 (a supplement in 1878-82); and the grand *Dictionnaire universelle du XIXème siècle* (15 vols., 4to) of Larousse, published at Paris in 1866-76. This is perhaps more properly an encyclopædia, since it contains essays of some length on various subjects. The revised edition, published in 7 volumes under the title *Nouveau Larousse illustré* (Paris, 1898-1904; supplement, 1907), and under the editorship of Claude Augé, contains less discursive matter, but a greater variety of articles covering the entire field of knowledge—all in one general vocabulary—combining fiction, history, biography, geography, dictionary of words, etc.

Among the modern dictionaries in two or more languages, those treating of technical terms are of special interest. There are now numerous dictionaries of this class, many of them having a vocabulary in three languages, commonly German, French, and English. Their definitions are usually merely by synonyms or the briefest kind of description, their purpose being to meet the needs of the technological or scientific student. A recent dictionary of this class is the *Technological Dictionary*, edited by Alexander Tolhausen, published in 1901 at Leipzig, in three thick duodecimo volumes. The vocabulary is in German, French, and English respectively in the three volumes.

The form and contents of the modern dictionaries are the outcome of long experience. The first dictionaries were mere word lists arranged according to subjects or even miscellaneous. The alphabetic arrangement is comparatively recent and has entirely replaced the older ones. The plan of giving scientific etymologies and of arranging definitions in the order of their historic development, both now typical of the best dictionaries, first began to take definite shape in the work of Noah Webster. The use of illustrations in dictionaries is old, but heretofore only those illustrating the mechanical arts were generally dependable for scientific accuracy. The general and free use of illustration of animals and plants with a reasonable approach to accuracy dates from the publication (about 1850) in England of a revision of Webster's Dictionary under the name of Ogilvie's *Imperial Dictionary*. This was well and copiously illustrated, many of its illustrations still finding a place in the standard dictionaries of to-day. The most notable general English dictionary with illustrations prior to Ogilvie's was that entitled *Dictionary of Arts and Sciences* (2 vols., 4to, London, 1806) by G. Gregory. The work is profusely illustrated with steel engravings of the arts and sciences and natural history and combines the features of a dictionary and an encyclopædia. The illustrations in natural history, however, lack the scientific accuracy characteristic of modern dictionaries and encyclopædias. The dictionary of to-day is distinguished also by being no longer a one-man work, as in the days of Johnson and

Webster, but a coöperative product, engaging the services of many special and general editors working under a chief of staff, or managing editor, the whole work being subject to the direction of an editor in chief, who endeavors to give it unity, uniformity, and completeness.

**DICTOGRAPH.** This instrument, which has figured in many criminal trials since 1912, consists of the adoption of an ordinary telephone circuit with a sensitive granular carbon transmitter with a diaphragm somewhat greater than usually employed, so as to increase the reproduction of the sound at the receiving end of the line. Such a transmitter, small and inconspicuous, could be placed in the room where suspected persons would hold conference or conversations, and wires led to a recording station, where a stenographer could record the spoken words. In large auditoriums a number of transmitters have been used to reproduce the sounds at different parts of the hall, and a similar device with a loud-speaking telephone receiver has been installed in the waiting rooms of various railway stations.

**DICTUM** (Lat., a saying, utterance, response of an oracle), sometimes called *obiter dictum*, i.e., an opinion pronounced 'by the way.' In legal parlance, an unauthorized expression of opinion on a point of law uttered by a judge in a judicial proceeding. In a legal system based, as is that of England and America, largely upon precedent, only so much of a judicial opinion as is directly concerned with the decision of the case in hand has commanding authority. This is due to the fact that the courts have no power to decide cases not before them for adjudication. The principle of *stare decisis*, i.e., of abiding by a rule once settled by a formal decision, invests such a decision with the force of law and makes it a binding authority upon the courts in similar cases. But a decision upon a collateral point, or upon a state of facts not before the court for its determination, has no such binding force. It is a mere pronouncement, or expression of opinion, which derives its authority solely from the learning and personal weight of the judge declaring it. It is usual, therefore, to distinguish between the "law of a case" and the dicta, or judicial opinions expressed in it, which, however important and influential they may be, have not the force of law. This process of "sifting" the law from the dicta of a judicial opinion is one of the chief, as it is one of the most difficult, functions of the lawyer and the judge.

It is not to be inferred, however, that judicial dicta are entirely without legal authority. The opinions of eminent and learned judges have the same weight with the courts as that which attaches to the disinterested opinions of great lawyers and legal writers, and are classified as having "persuasive" as distinguished from "imperative" authority. It is often desirable and sometimes necessary to resort to such opinions as an aid to the formation of a sound though independent judgment upon a question of law, and many cases have been decided and many important legal doctrines established in deference to such authority. In this view of the matter judicial dicta constitute a long and valuable series of commentaries on the law of the land, scattered through the law reports, to which resort may be had as to the more systematic writings of eminent lawyers and judges, as those of Coke, Blackstone, Kent, and Story.

Consult Wambaugh, *The Study of Cases* (2d ed., Boston, 1894). See JUDGMENT; OPINION.

**DICTUM OF KENILWORTH.** An agreement between Henry III and the rebellious barons, so called because made during the siege of Kenilworth in 1266.

**DICTYNDÆ** (Neo-Lat. nom. pl., from Gk. *δίκτυον*, *diktyon*, net + *εἶδος*, *eidos*, form). A family of spiders that weave irregular webs in which two kinds of silk are used. See SPIDER.

**DICTYONEMA** (Neo-Lat., from Gk. *δίκτυον*, *diktyon*, net + *νῆμα*, *nēma*, thread). A genus of fossil graptolites in which the colony, when found pressed out on the surface of a slab of shale, has the appearance of a network of delicate filaments made up of heavier cell-bearing branches that radiate from a common base and are united at frequent intervals by slender horizontal threads. The genus ranges from the uppermost Cambrian to the Carboniferous and is especially abundant in lowest Ordovician "Dictyonema shales" which form such a persistent zone in the Baltic Provinces, Scandinavia, England, eastern Canada and New York. *Dictyonema flabelliforme*, the best-known species, had a colony 5 to 10 inches long that grew in the shape of a funnel from a single rootstock. See GRAPTOLITE.

**DICTYOSPONGIDÆ** (Neo-Lat. nom. pl., from Gk. *δίκτυον*, *diktyon*, net + *σπόγγος*, *spongos*, sponge). A family of usually large, fossil lysacine sponges somewhat closely allied to the existing glass sponges (*Euplectella*), and found in rocks of Lower Devonian to Lower Carboniferous age, but chiefly in those of Upper Devonian age in New York State. In form these sponges vary from ovate, cylindrical, and prismatic to funnel-shaped. They have a large central cavity, and thin walls in which the siliceous spicules formed a skeleton of great regularity, so that the surface of the fossil is ornamented by a network of fine rectangular meshes. As the sponge substance itself was decomposed and the siliceous spicules dissolved during the processes of fossilization, these organisms appear at present as casts of the original organic matter, imbedded in shaly sandstones, and their structure is indicated by the impressed lines upon their surfaces, and in some cases by the iron oxide (limonite) which occupies the cavities once filled by organic tissue or spicules. Some of these sponges have very simple form with smooth surface; others are radially or transversely ribbed, and still others are spiny or nodulose, while a few have pouched nodes upon their surfaces.

In the region where these fossil sponges have been found in greatest abundance—viz., in Allegany, Cattaraugus, and Steuben counties of New York State—they occur in sandy shales or sandstones in such manner as to indicate that they lived often in extensive colonies on sandy or muddy bottoms, and they are not as a rule associated with any considerable number of other kinds of fossil organisms. The earliest species, *Dictyospongia Danbyi*, from the Upper Ludlow rocks of England, has a simple, sub-ovate form. The more ornamented forms appear in the Upper Devonian and Lower Carboniferous rocks. The principal genera are *Dictyospongia*, *Uphantania*, *Hydnoceras*, *Prismodictya*, and *Thysanodictya* of the Chemung rocks, and *Phragmodictya* and *Physospongia* of the Keokuk group of Lower Carboniferous age. About 200 species are known, of which number scarcely

more than half a dozen are European. An elegant monograph, with fine lithographic plates of these fossil sponges, was published by James Hall and J. M. Clarke as "A Memoir on the Paleozoic Reticulate Sponges of the Family Dictyospongiada," in *Memoirs of the New York State Museum of Natural History*, vol. ii (Albany, 1898). See SPONGE; SPONGIOZOA.

**DICTYOTALES.** A small group of marine algae of very uncertain affinities. They are chiefly interesting on account of the combination of characters. They have a brown pigment characteristic of the brown algae, tetraspores characteristic of the red algae, and sperms peculiar to themselves. In general, they are regarded as an aberrant group of red algae.

**DICTYUS** (Lat., from Gk. *Δικτυς*, *Diktys*) or **CRETE.** A Greek writer. He was supposed to have been a companion of Idomeneus in the Trojan War, of which he wrote an account. The Latin version (dating from the fourth century A.D.) of this fabulous history was long alone extant. The Greek original was used by Malalas in his chronography (c.570 A.D.) and by other Byzantine writers. A fragment of the version on a papyrus of the third century A.D. was found by Grenfell and Hunt in 1904-05 and published in the *Tebtunis Papyri*, 2 (1907). The prologue of the Latin version and Suidas (q.v.) inform us that the original work of Dictys was written in Phœnician letters on bark and buried with him at Cnossus, in Crete, but that in the thirteenth year of Nero's reign (66 A.D.) the tomb was burst by an earthquake and the Phœnician book thus discovered. This was then presented to Nero, who ordered it translated into Greek. The Latin version bears the name of one Septimius as its author and conforms closely to the newly discovered Greek version. The work belongs to the body of fictitious literature which began to be written in the Hellenistic period. In the Middle Ages it was much read and, with the spurious history of Dares the Phrygian (q.v.), became the source of romance. Consult: Griffin, *Dares and Dictys: Introduction to the Study of the Medieval Versions of the Story of Troy* (Baltimore, 1907); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii (5th ed., Munich, 1913). For the text, in both Latin and Greek, consult Ihm, in *Hermes*, 44 (1909).

**DICYCLIC PLANTS.** See BIENIALES.

**DICYNODON**, di-si'nô-dôn (Neo-Lat., from Gk. *δύς*, *di*, double + *κύνω*, *kyôn*, dog + *δόν*, *odous*, tooth). A genus of fossil reptiles found in the Permian and Jurassic rocks of South Africa and Russia, while closely allied forms occur in India and Scotland. The animal was a land reptile of heavy build, with limbs constructed for walking with the body well raised off the ground. Some forms are as small as a rat, but the majority of the species vary in size from that of a new-born to a half-grown pig. A few only are of large size, the largest known having a skull about 2 feet in length. In most points of structure the animal closely agrees with the mammals, having the temporal arch similarly built and having a mammal-like shoulder girdle and pelvis and the same number of joints in the toes, viz., 2, 3, 3, 3, 3. The striking specialization from which its name is derived is the presence of a pair of large canines which often form walrus-like tusks. In most species these are absent in the female. The front of the jaws is covered

with a horny beak like that of a tortoise. In an allied genus *Endothiodon*, there are no tusks, but a row of small molar teeth. See THEROMORPHA.

**DIDACHE**, did'a-kâ. See TEACHING OF THE TWELVE APOSTLES.

**DIDACTIC POETRY.** That kind of poetry which aims, or seems to aim, at instruction as its object, making pleasure entirely subservient to this. It has been disputed whether the existence of a kind of poetry especially entitled to the name "didactic" consists with the true nature and object of the poetic art, for it is held that to point out instruction as the peculiar object of one kind of poetry is to overlook the high aim of all poetry, and that a poem may be in the highest sense ethical without any obvious aim at instruction. The drama of Shakespeare has an immense ethical or moral value, but it is not didactic. Examples of purely didactic poetry are Vergil's *Georgics*, Horace's *Ars Poetica*, Pope's *Essay on Criticism* and *Essay on Man*.

**DIDELPHIA** (Neo-Lat., from Gk. *δίς*, *di*, double + *δελφίς*, *delphys*, womb), or **METATHERIA.** The second of the three great subclasses of mammals (q.v.), containing only the single order Marsupialia (q.v.). The name is derived from the "double" condition of the womb in the female, where the uterine dilations of the oviducts continue through life distinct from each other. There are also two vaginæ, each with its own opening into the cloaca, into which the rectum and ureters likewise open. There is no well-developed placenta, and it is generally entirely wanting, though it is now thought that its absence is a secondary condition and not primitive, as it has been shown to be present in the early stages of development in the bandicoots (Perameles).

**DIDEROT**, dé'd'rô', DENIS (1713-84). One of the most brilliant, versatile, and prolific writers of the French "philosophic" generation, nicknamed "Pantophile Diderot" by Voltaire, because of his unbounded interest in almost every branch of human activity. He was born at Langres, Oct. 5, 1713, and was educated by the Jesuits. He declined to study law, quarreled with his family, and eked out a meagre livelihood in young manhood by literary hack work and teaching mathematics. After several discreditable Bohemian adventures he married (1743) and became definitely estranged from his father. In this year he published translations of Stanyan's *History of Greece*, and in 1746 a translation of James's *Dictionary of Medicine*, with an *Essai sur le mérite et la vertu*, a paraphrase of Shaftesbury. The *Pensées philosophiques* of this year was his first independent work and is said to have been inspired by a caprice of his mistress, Madame de Puisieux, who certainly prompted his anonymous and most indecent novel, *Les bijoux indiscrets* (1748), of which he was ashamed in his later years. Diderot's first work of philosophic importance is the *Lettre sur les aveugles à l'usage de ceux qui voient* (1749), which, though apparently a hypothetical study of the philosophy of sensation, really involved an undermining of ethical standards and so of social order. This essay abounds in strange provisions of later discoveries and hypotheses, such as the suggestion of developing the sense of touch among the blind. Its immediate result was the imprisonment of its author at Vincennes be-

cause a passage in it offended a lady of great though unavowable influence. From imprisonment Diderot was released at the urgency of the publishers who had undertaken to bring out the famous *Encyclopédie*, originally conceived by Diderot as an enlargement of *Chambers's Encyclopaedia* (1727), but becoming, under his editorship and for a time that of D'Alembert, the organ of intellectual emancipation rather than of any school of ethics or philosophy. To this Diderot gave 20 years of unremitting labor, writing, revising, editing, correcting, supervising, and combating the intrigues and threats of theological opponents and the prohibitions of a censorship that, fortunately for his publishers, was venal as well as corrupt. The *Encyclopédie* counts 28 volumes (1751-72), with a six-volume supplement (1776-77) and two volumes of tables (1780). It was not primarily or chiefly revolutionary, but practical. All branches of science, manufacture, and agriculture were treated with great fullness. It is only occasionally, and then often by mocking insinuation rather than direct attack, that it touches religion or morals, in which it has no consistent theory to uphold. The attacks on legal abuses and feudal survivals are quite as marked a feature. The work was greeted with immense enthusiasm and was reprinted several times. Though engaged in this Herculean work, Diderot managed, with characteristic superabundance of energy and bigness of heart, to help his literary comrades, when he did not actually rewrite their works entirely for them, and even composed two plays—*Le fils naturel* (1757) and *Le père de famille* (1758)—that mark the beginning of the modern domestic drama, and by his critical *Paradoxe sur le comédien* had great influence on Lessing and so on the German stage. The French classic tragedy had confined itself to "noble" themes. Diderot took his tragic situations from everyday middle-class life, thus sowing the germs of the melodrama in France. To this period belong also an essay on painting in the *Encyclopédie*, which Goethe translated, adding a luminous commentary; his posthumously published novel, *La religieuse* (1759); the eccentric *Jacques le fataliste* (1773), also posthumous; and the yet more eccentric *Le neveu de Rameau*, which first appeared in print in a translation by Goethe (1805). In his critiques on the annual exhibition of painting, the famous Salon, Diderot established the first bond between art and literature; still he can hardly be considered an art critic, owing to his ignorance of its technique and his undue insistence on the mere subject or idea of the work. In 1773 Diderot, who had received but \$600 a year for his work on the *Encyclopédie*, felt constrained to sell his library to furnish a suitable dowry for his daughter. It was purchased by Catharine II and presented to him as salaried caretaker. He went to St. Petersburg to thank the Empress and spent some months there in her intimate society. He returned in 1774 and passed his last decade in ephemeral writing and conversations that, full of powerfully stimulating ideas as they were, left lasting impressions. In talk his contemporaries thought him unrivaled; this is borne out by the fact that his influence on his contemporaries was tremendous, even though most of his really original compositions were published after his death. "He who knows Diderot in his writings only," said Marmontel, "does not know

him at all." He worked and talked with disinterested enthusiasm, greeting the mention of a collected edition of his writings with laughter, so well did he know the reckless haste of their composition. A certain sentimental strain infused into him by the works of Sterne and Richardson, his own sincere appreciation of nature, and his natural though unselfish lyricism, easily mark him as a precursor of the Romanticists, even ahead of Rousseau in point of time. His works have been well edited by Assezat and Tourneux (20 vols., 1875-79). Diderot's *Correspondence* with Mademoiselle Voland gives the best clue to his antithetical character. The best study, in English, of his place, environment, and influence is John Morley, *Diderot and the Encyclopedists* (London, 1891). Consult also: Rosenkranz, *Diderot's Leben und Werke* (Leipzig, 1866); Brunetière, *Etudes critiques* (2d series, Paris, 1881); Carlyle, *Essay on Diderot* (London, 1881); G. Lawson, *Histoire de la littérature française* (Paris, 1912); A. Collignon, *Diderot* (ib., 1907); A. Tornézy, *La légende des philosophes* (ib., 1911); R. L. Cru, *Diderot as a Disciple of English Thought* (New York, 1913).

**DIDIER**, dè'dyà', JEAN CHARLES HENRY (1805-64). A French writer, born in Geneva. After a visit to Italy he published his *Rome souterraine* (1833), a work of fiction which affords a brilliant picture of the revolt against Austria and other matters of Italian history. He wrote: *Une année en Espagne* (1837); *Campagne de Rome* (1842); *Promenade au Maroc* (1844); *Séjour chez le schérif de La Mecque* (1856); *Cinquante jours sur le Nil* (1857); *Cinq cents lieues sur le Nil* (1858).

**DIDION**, dè'dyòn', ISIDORE (1798-1878). A French soldier and author, born at Diedenhofen. He was educated at the Ecole Polytechnique and the Academy of Metz; in 1848 was appointed director of the percussion-cap manufactory of the French army in Paris. In 1858 he became a general of brigade. He wrote on the science of projectiles, including *Traité de balistique* (1848; 2d ed., 1860); *Cours élémentaire de balistique* (1864; 3d ed., 1859); *Progress des sciences et de l'industrie* (1875).

**DIDIUS SALVIUS JULIANUS**, MARCUS. A Roman emperor, March to June, 193. He had commanded the army in Germany and held high military and civil posts in Italy and the provinces, and been named consul more than once. On the murder of Pertinax in 193, the praetorian soldiers offered to support as emperor whoever would give them the largest price. Didius gave them 25,000 sesterces each and gained the throne, but was soon deposed by the Senate on the approach of Septimius Severus, and murdered by a soldier.

**DIDO** (Lat. from Gk. Διδώ), or ELISSA. According to the legend, the founder of Carthage. She was the daughter of a king of Tyre, called by some Agenor or Belus, by others Muto or Matgenus. His successor, Pygmalion, the brother of Dido, murdered her husband (who was also her uncle), a priest of Hercules named Acerbas or Sicharbas, called Sycheus by Vergil. With the treasures of Sycheus, which Pygmalion had sought for in vain, and accompanied by many Tyrians, Dido escaped to sea. She landed in Africa, not far from the Phoenician colony of Utica, and built a citadel called Byrsa (a Phoenician word, confused with Gk. βύρα, the hide of a bull), on a piece of ground

which she had bought from the Numidian King, Iarbas. The meaning of the word "Byrsa" gave rise to the legend that Dido purchased as much land as could be encompassed with a bullock's hide, and that after the agreement she cut the hide into small thongs and thus inclosed a large piece of territory. Here she built the city of Carthage. To avoid being compelled to marry Iarbas, she stabbed herself on a funeral pile, which she had caused to be erected (consult Justinus, xviii, 4-7); after her death she was honored as a deity by her subjects. Vergil, however, ascribes the death of Dido to her unrequited passion for Aeneas (*Aeneid*, i-iv, especially iv); but many of the ancient writers conceived that the poet had committed an anachronism in making her contemporary with the Trojan prince. The more general opinion was that Dido had built Carthage somewhere between 50 and 100 years before the foundation of Rome. Consult Meltzer, *Geschichte der Carthager*, vol. i (Berlin, 1879), and his article "Dido," in Roscher's *Lexikon der griechischen und römischen Mythologie*, vol. i (Leipzig, 1884-90), and Rosbach's article "Dido," in Pauly-Wisowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. v (Stuttgart, 1905).

**DIDON**, dā'dōn', JEAN HENRI (1840-1900). A French Dominican who in the latter half of his life stood in the front rank of French pulpit orators. He was born at Touvet, entered the Order of St. Dominic in 1862, and during several years preached a famous series of Lenten conferences at Notre Dame in Paris. He died at Toulouse, March 13, 1900. Of his publications there have been translated into English: *Science Without God* (1882); *The Germans* (1884); *Jesus Christ* (2 vols., 1891-92); *Belief in the Divinity of Jesus Christ* (1894). Lives have appeared by De Coulanges (Paris, 1901); Reynaud (ib., 1904), and Brissson (ib., 1905).

**DIDOT**, dā'dō'. The name of a family of French printers and publishers founded by FRANÇOIS DIDOT (1689-1757).—Of his eleven children, FRANÇOIS AMBROISE (1730-1804), who introduced the vellum paper into France, and PIERRE FRANÇOIS (1732-95) were distinguished printers, and the latter's eldest son, HENRI (1765-1852), was a noted type caster, engraver, and mechanician. A descendant of Pierre married Bernardin de Saint-Pierre, who wrote *Paul et Virginie* at a country house near the Didot paper manufactory at Essonne.—PIERRE DIDOT (1760-1853), the eldest son of François Ambroise, produced then unexcelled editions of French and Latin classics; his brother, FIRMIN (1764-1836), was greatest of them all as printer, engraver, and type founder. He invented the word "stereotype," and used the process largely, revolutionizing the book trade by his cheap editions. His manufactory was a place of pilgrimage for the printers of the world. He was also a respectable dramatic author and translator of the classics and achieved reputation as a moderately liberal politician and deputy. His sons and grandsons have continued the business with honor, but with no increase of fame. France is indebted to this family for the publication of the *Biographie Nationale*, and Belgium is likewise for the establishment of her Royal Press. Consult

E. Werdet, *Etudes biographiques sur la famille des Didot* (Paris, 1864), and Alfred Cecil Piper, "Some Great Printers and their Work: the Didots," in *Library World* (London, 1914).

**DIDRON**, dē'drōn', ADOLPHE NAPOLEON (1806-67). A French archaeologist, born at Hautevillers (Marne). Acting on the advice of Victor Hugo, he turned his attention to Christian archaeology, examined nearly all the old church edifices of France, and extended his knowledge by travels in Greece, Germany, England, and Italy. In 1835 he was appointed secretary to the Historical Committee of Arts and Monuments, founded by Guizot, and in 1844 he established the *Annales Archéologiques*, which became the main source of information in France on mediæval art and antiquities, and was edited by him until his death. He founded a special publishing house for archaeological works in 1845, and established a manufactory of stained glass in 1849, and one for bronzes and goldsmith's ware in mediæval style in 1858. Among his works are: *Histoire de Dieu: iconographie des personnes divines* (1843); *Manuel d'iconographie chrétienne, grecque et latine* (1845); *Manuel des objets de bronze et d'orfèvrerie du moyen âge: Iconographie de l'opéra* (1884).

**DIDSBURY COLLEGE**. One of the theological institutions maintained by the Wesleyan church of England. It is situated near Manchester. It was founded in 1842-43 as the result in part of the effort made in 1839 to raise a large fund to commemorate the centenary of the founding of Methodism. Among the many noted men who have been members of its faculty are to be numbered W. B. Pope, the distinguished theologian, and Professor Geden, the learned biblical scholar. It has always been noted for the strength of its faculty and the quality of its work.

**DIDUN/CULUS** (Neo-Lat., diminutive of *didus*, from Portug. *doudo*, dodo, foolish). A genus of a family (Didunculidæ) of pigeons, peculiar to Samoa and characterized by a hooked upper mandible and a toothed lower one—the tooth-billed pigeons. See PIGEON.

**DIDYMA**. See BRANCHIDÆ.

**DIDYMI**, or **DIDYMOI**. See BRANCHIDÆ.

**DIDYMIUM** (Neo-Lat., from Gk. *δίδυμος*, *didymos*, twin, from *δι-*, *di-*, double + *δῶς*, *dōs* two; so called from being found in the same mineral which yields lanthanum). A metal discovered in 1842 by Mosander, in the mineral cerite. It is also found in gadolinite, orthite, and other cerium minerals. Recent investigations have shown that didymium consists of two elements, *neodymium* (symbol Nd, atomic weight 143.6), and *praseodymium* (symbol Pr, atomic weight 140.5).

**DIDYMOGRAPTUS** (Neo-Lat., from Gk. *δίδυμος*, *didymos*, double + *γράφω*, *grapho*, I write). A genus of graptolites, of which the rhabdosome consists of four symmetric branches growing from an axillary sicula. The thecae are simple and tubular. The genus furnishes important index fossils for the Ordovician and contains about 40 species, found abundantly in the graptolite shales of the lower and middle Ordovician in Europe, America, and Australia. Some species, as *Didymograptus bifidus* and *Didymograptus nitidus*, have a world-wide distribution. See GRAPTOLITE.
